Circular economy business models for the manufacturing industry

Circular Economy Playbook for Finnish SMEs
This playbook is tailored to companies in the Finnish manufacturing industry, giving detailed examples for the following four sub-sectors:

It specifically addresses companies that want to

- Better meet customer expectations and deliver customer outcomes
- Enable outcome-oriented solutions and new levels of efficiency through technology and digitalisation
  - Improve resource utilisation and mitigate risk from regulatory, investor and societal pressures

The playbook calls for action by

- Describing the rationale for why circular economy is relevant (Chapter 1)
- Identifying circular business models with highest value potential per sub-sector (Chapters 2 & 6)
  - Outlining required organisational and operational changes (Chapters 3 & 4)
- Providing a blueprint of a transformation journey for companies to achieve circular advantage (Chapter 5)
Playbook content

Executive Summary

1. Why
   Why is Circular Economy relevant?
   Rationale for Finnish manufacturing companies to engage in circular economy

2. What
   What concrete opportunities exist?
   Current state analysis and circular opportunities for the manufacturing industry

3. Capabilities
   Which capabilities are required?
   Introduction to organisational requirements for circular business models

4. Technologies
   Which technologies can support?
   Overview of technologies that can enable circularity

5. How
   How to design the transformation journey?
   Guidance on key steps towards circular advantage and how to overcome typical barriers

6. Deep dives
   Industry deep dives
   Machinery & Equipment, Marine, Energy & Transportation
### A set of tools complement the playbook, and help you get started with your circular journey

</table>
Executive Summary

- The way we currently design, produce and use products is leaving a lot of value on the table, which is why we need to rethink the linear manufacturing industry.
- The aim of circular economy is to maximise the time products, components and materials are kept in use – it is an endless cycle that captures untapped value potentials of the traditional take-make-dispose value chain.
- Successful transition towards circular economy is critical to innovation and continued growth, and time is now right to drive the pace of adoption in the Finnish manufacturing industry.
- Circular economy principles have been around for centuries, but it is not until recently that circular business models have gained increased traction as they are being powered by rapid technology development and increased focus on delivering customer outcomes.
- Leading companies are focusing on customer outcomes and redefining their value chains to enable efficient delivery.
- Circular business models can be applied across the entire value chain – however, the biggest value potential is typically achieved during the product usage phase, requiring increased forward integration of manufacturing companies.
- Successful transformation into circular business requires a considerable shift in capabilities, mindset and collaboration as manufacturing companies will have to adapt their products and solution design, and continuously engage with their customers and ecosystem partners.
- Business intelligence derived from IoT, sensors and analytics to improve life-time productivity can increase value by enabling high life-time revenues and increased profit margins on installed base.
- Companies within the Finnish manufacturing industry are strongly committed to circular economy and recognises its connection to growth and profitability, and the supporting ecosystem is also starting to mature.
- Circular economy cannot be achieved by one company alone, and collaboration between traditional and new actors in the ecosystem will be required to close the loops efficiently.
- We invite you to use this playbook to find your role in the circular ecosystem.

Quotes from the authors

"Circular economy is far from common knowledge in the manufacturing sector. Especially, companies struggle to take the last leap towards ‘as a service’-models, as it requires a huge shift in business logic, mindset and culture. With digital solutions, and this playbook and tools, companies are receiving the missing link, a measurable business case, that turns inefficiencies in current linear value chains and new circular opportunities into business value."

*Jyri Arponen, Senior Lead, Business Development, Circular Economy, Sitra*

"Finnish technology companies have already taken big steps, when it comes to energy and material efficiency. However, circular business models are still a largely unexploited opportunity. I am glad that we now have concrete examples and tools to help Finnish SMEs forward in their transformation journey”

*Laura Juvonen, Executive Director, Growth and Renewal, Technology Industries of Finland*

"Deep-down, circular economy is all about customer-centricity - creating customer-centric solutions using new technologies in a sustainable way. This requires a new mindset, new capabilities and new kinds of partnerships. This playbook provides practical guidance for companies willing to achieve the circular advantage."

*Pekka Vanne, Managing Director, Accenture Strategy*
Executive Summary

1. Why
2. What
3. Capabilities
4. Technologies
5. How
6. Deep dives

Quotes from selected companies

“An eye-opening experience, with not only on path to follow, but several interesting avenues to pursue circular economy possibilities and opportunities. Circular economy is not only a case of recycling things, this is an opportunity to re-invent your business – an opportunity to re-think your business model.”

Jouni Teppo, Managing Director, Sisu Axles

“It is great to see a systematic and thought provoking set of concrete tools and a process to assist companies moving towards circular economy. The sooner the corporate strategy and activities are steered towards circular economy, more competitive advantage and sustainable growth can be gained. This will attract financiers and in the long run it will become a requirement for their participation.”

Jussi Hattula, Director, TESI

“The circular economy playbook gave us a great framework for assessing where the best circular economy opportunities for our company would be. It also helped us to define the most attractive ideas and guided us think about the business cases behind them. The first projects that lead us to the right direction have already been started”

Matias Impivaara, Vice President Business Growth and Development, Beneq

“Nokia realises that it is ideally placed to enable the move towards a zero-emission digital future. In our own operations we are continually driving efficiencies in our supply chain, improving on already high levels of product takeback, reuse and recycling offering and supporting sharing business models by providing leading edge connectivity. Collaborating using this capability and ambition to build toolkits and improve understanding of the importance and opportunities of circularity will build sustainable momentum needed in closing the loop.”

Pia Tanskanen, Head of Environment, Nokia
The playbook and supporting tools will provide you with in-depth understanding on how to achieve circular advantage

The playbook consists of 6 chapters and supporting tools for identifying company specific circular opportunities

1. Why circular economy?
   - Burning platform for circular economy
     - Inefficiencies of the linear value chain
     - Drivers of circular economy
     - Leading examples

2. What opportunities exist?
   - Circular opportunities for manufacturing industry
     - Current state analysis
     - Circular business models
     - Value benefits

3. Which capabilities are required?
   - 9 circular capabilities
     - Detailed description
     - Required know-how
     - Recommended approach
     - Leading practices

4. Which technologies can support?
   - 19 technologies enabling circular business models
     - Detailed descriptions
     - Circular relevance
     - Assessment parameters
     - Risk assessment

5. How to design the transformation journey?
   - Circular transformation journey and roadmap
     - Envision and plan
     - Deliver and adapt
     - Barriers incl. culture, ecosystem collaboration, finance

6. Industry deep dives
   - Current state analysis and circular opportunities for
     - Machinery & Equipment
     - Marine
     - Energy
     - Transportation

+ Supporting tools, including for example value case tool, business model canvas, capability gap assessment tool, etc
Why is Circular Economy relevant?
Rationale for Finnish manufacturing companies to engage in circular economy
Why is Circular Economy relevant?

• Circular economy is relevant as it offers companies the opportunity to turn inefficiencies in linear value chains into business value

• These inefficiencies look beyond production waste, focusing on underutilised capacities, premature product lives, unsustainable materials, wasted end-of-life value and unexploited customer engagements

• Three drivers underpin the shift towards circular: the trend of increased customer-centricity, sustainability and enabling technologies

• Global and Finnish early movers have already started to successfully address inefficiencies through circular principles
Circular economy is about turning inefficiencies in linear value chains into business value

Inefficiencies of linear value chains

- **UNSUSTAINABLE MATERIALS**: Material and energy that cannot be continually regenerated
  - for example, direct and indirect materials are not renewable or bio-based

- **UNDERUTILISED CAPACITIES**: Underutilised or unused products and assets
  - for example, products are not operating full hours or full functionality is not useful

- **PREMATURE PRODUCT LIVES**: Products are not used to fullest possible working life
  - for example due to new models and features or lack of repair and maintenance

- **WASTED END-OF-LIFE VALUE**: Valuable components, materials and energy are not recovered at disposal
  - for example, not recycled or recovered at end of life

- **UNEXPLOITED CUSTOMER ENGAGEMENTS**: Sales organisation focus on selling functionality of product rather than the customer problem
  - for example, missing opportunities to engage customers throughout the product life-cycle to offer additional services and add-on sales

Source: Accenture, Appendix 2 for more details
Three drivers underpin the shift towards circular

1. Customer-centricity
   Delivers customer outcomes

2. Right delivery
3. Right purpose
4. Right efficiency
5. Sustainability
   Improves resource utilisation
6. Technology
   Enables new solutions

Source: Accenture, Appendix 2 for more details
Better customer values can be delivered through offering outcomes instead of selling products

From selling products... ... to offering outcomes

Profit is generated by selling as many products as possible, fuelling inefficiencies along the value chain

Example: From Rolls Royce selling engines...

Profit is generated by delivering solutions that fit specific customer needs, minimising inefficiencies and increasing consumer experience

... to Rolls Royce selling “Power by the hour” to customers for a fixed charge per hour of operation, per ship. Rolls Royce offers planned maintenance and monitoring services for the equipment aboard from on-shore with the help of sensors

Source: 1: Company website
Our overuse of natural resources drives regulators, investors and companies towards sustainability

Development of resource demand$^1$

Billion tonnes

- Regulatory pressure is increasing
- Investments are shifting towards responsible businesses
- Businesses raise supplier requirements

New consumption pattern needed

Gap in supply is driving changing market conditions

In 2015, the UN general Assembly, representing 193 countries, set the Sustainable development goals. Goal 12 aims, amongst others, at decoupling economic growth from natural resource use.

BlackRock CEO Larry Fink asks companies to make positive contribution to society$^2$

Companies request suppliers to disclose sustainability performance – 27% of CDP supply chain programme members, representing $2.7$tn in procurement spend, have supplier carbon emission targets$^3$

Sources: 1: Accenture, Appendix 2 for more details, 2: CNN, 3: CDP
Technologies are developing at a rapid pace and enable companies to deliver on circular economy objectives

Level of technology development

<table>
<thead>
<tr>
<th>Emerging</th>
<th>Improving</th>
<th>Maturing</th>
<th>Scale-up</th>

Source: Company websites
CFOs of Finnish manufacturing companies fear competition from digital disruptors that take over customer relationships

19% of CFOs from Finnish manufacturing companies named customer data managed by other companies as the biggest risk from disruptive companies or technologies.

Disruptors may start with one service...
Disruptor gets access to customer data

2000-2010: Google evolved from providing search engine to browser to smart phone operating system

... developing into a key digital platform for users ...
Disruptor extends access to digital and physical (e.g. location) data, becoming the interface for digital services for a certain product whose producer did see the opportunity and answered the need for digital innovations quick enough

2010 - ?: Google offers all sorts of applications incl. navigation and engages in development of self-driving car technology through Waymo collaboration

... with potential to commoditise products in the future
Disruptor getting into position to control all data and thus enabled to define customer experience, making the product in the field a commodity

Vision: Alphabet establishes biggest fleet of autonomous vehicles, wins race to safest technology and generates momentum to urge OEMs to use its platform and establishes monopoly

Source: 1: CTO survey results, Fall 2017
Finnish technology adaptors are already successfully using the three drivers to generate value and fight disruptors

**Tamturbo provides ‘Compressed air-as-a-Service’ to industrial companies**
- Compressor has high-efficiency electric motor
- Customers avoid high initial investment and hassles with maintenance
- Compressors are reinstalled at new clients at the end of contract

**eRent\(^1\) offers a platform to track, manage, rent and rent out equipment**
- Service combines digital tracking methods, internet of things and cloud services
- Customers get easily accessible, mobile application
- Platform maximises usage rate of equipment

**Wärtsilä subsidiary Eniram offers full visibility of onboard operations of a vessel with an analytics solution**
- Advanced algorithms decompose and model data
- Mobile app was jointly developed with customers
- Fuel savings are derived from optimisation and breakdown is reduced

\(^1\) Start-up company in early stage-development
What concrete opportunities exist?
Current state analysis and circular opportunities for manufacturing industry
This chapter will help you to:

• Assess your company’s current state through evaluation of inefficiencies in your value chain

• Understand and identify circular business models that can help your company address inefficiencies and achieve a competitive advantage

Supporting tools:

• Business model development toolkit

• Value case tool

CHAPTER SUMMARY

What concrete opportunities exist?

• To address inefficiencies in the linear value chain and circulate products and materials, manufacturing companies should explore the five circular business models and their sub-models

  Circular Supply Chain

  Sharing Platform

  Product Life Extension

  Recovery & Recycling

  Product as a Service

• Currently, the adoption of circular business models of SME’s in the Finnish manufacturing industry is limited

• Compelling circular business model examples from leading Finnish and global manufacturing companies demonstrates a strong case for circularity

• Understanding current inefficiencies of the linear model is a helpful starting point to identify most promising circular business models
Manufacturing is the backbone of the Finnish economy, accounting for 80% of all exports

Finnish exports by industries, 2017

The four sub-sectors in scope account for 36% of Finland’s manufacturing exports

Source: Finnish Customs
The playbook takes a deep dive into four important ecosystems within the Finnish manufacturing industry

**Machinery & Equipment**
Manufacture of machinery and equipment, including e.g. engines and turbines, pumps, compressors and valves, agriculture, forestry, mining and metallurgy machinery, and lifting and handling machinery.

- Largest sector of the Finnish manufacturing industry, accounting for 13% of Finland’s exports and employing 15% of the workforce.

**Marine**
Manufacture of ship parts and marine equipment, such as hull, propulsion and power engines, other systems and solutions and interior equipment.

- Over 900 companies with a turnover of EUR 8 billion, of which approximately EUR 1 billion from shipbuilding.

**Energy**
Manufacture of electrical equipment, such as batteries, accumulators, wiring and wiring devices, electric lighting equipment, transformers and electricity control apparatus.

- Employs over 15 000 people in Finland.

**Transportation**
Manufacture of motor vehicles, trailers and semi-trailers, and their parts and equipment.

- Export value of EUR 3 billion with strong expertise in special vehicle manufacturing.

A detailed overview of the current state and leading circular economy examples of each industry can be found in Chapter 6.

Sources: Statistics Finland, Finnish Customs, Finnish Marine Industries
**Substantial inefficiencies occur in all parts of the manufacturing value chain**

<table>
<thead>
<tr>
<th>Inefficiency</th>
<th>Inefficiency level</th>
<th>Description of quantitative results</th>
<th>Comments on the current state</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct materials</td>
<td>Medium</td>
<td>For 55% of companies the spend on recyclable/renewable materials is 50% or more of direct material spend, while 20% spend less than 5% on renewables.</td>
<td>Most input materials are recyclable and durable (e.g. steel) and the use of recycled material is fairly common.</td>
</tr>
<tr>
<td>Indirect materials</td>
<td>High</td>
<td>55% of companies spend less than 20% of their indirect material spend on recyclable/renewable materials, and only 11% spend more than 80%.</td>
<td>Only some companies use sustainable indirect materials in production, such as renewable energy or recycled packaging materials.</td>
</tr>
<tr>
<td>Availability</td>
<td>Medium</td>
<td>58% of companies report that their products are idle for over 20% of the time, of which half say products not used for 50% or more of the available time.</td>
<td>The full available time of products is often not utilised, e.g. due to seasonal downtime. Also, all companies do not operate on a 24/7 basis.</td>
</tr>
<tr>
<td>Operational fit</td>
<td>Very low</td>
<td>70% of companies fully customise their products to meet customer needs and requirements, while the rest meet customer expectations with a standard solution.</td>
<td>Products are designed to fit customer needs and requirements, e.g. in terms of operational efficiency.</td>
</tr>
<tr>
<td>Lifetime</td>
<td>Low</td>
<td>50% of companies report that their products last for over 20 years, while another 43% report that their product lifecycle is 11-20 years long.</td>
<td>Most products are built for long lifecycles with high durability.</td>
</tr>
<tr>
<td>Functionality</td>
<td>Very low</td>
<td>For 65% of companies the share of revenues coming from products that are designed for a long life is 80%.</td>
<td>Products are designed to be long-lasting – however, design for enhanced reparability, modularity and upgradeability is limited.</td>
</tr>
<tr>
<td>Waste in production</td>
<td>Medium</td>
<td>38% of companies recycle over 80% of their production waste. However, 38% of companies say they recycle less than 10%.</td>
<td>Most production waste is recycled, and many companies report that in general their level of production waste is very low. Still, there are companies with limited efforts.</td>
</tr>
<tr>
<td>Take-back</td>
<td>Very high</td>
<td>For 87% of companies the share of products taken back from customers in dedicated return schemes at end-of-life is less than 5%.</td>
<td>Few companies have dedicated take-back schemes as disposing products at their end-of-life is often seen as the customer’s responsibility.</td>
</tr>
<tr>
<td>Recycling</td>
<td>Low</td>
<td>40% of companies recycle over 80% of products at end-of-life. Nevertheless, 28% say that they recycle less than 5% of products.</td>
<td>Product recycling rates are high for most companies. However, some companies do not recycle their product at all.</td>
</tr>
<tr>
<td>After-sales</td>
<td>High</td>
<td>For 68% of companies the share of revenues from add-on sales is less than 10%, while for industry leaders it can be up to 60% depending on their strategy.</td>
<td>The full potential of after-sales services is not exploited.</td>
</tr>
<tr>
<td>Add-on sales</td>
<td>Very high</td>
<td>86% of companies state that their share of revenues from add-on sales is less than 10%.</td>
<td>For most companies add-on sales efforts are currently limited.</td>
</tr>
</tbody>
</table>

<td>Take back and perform industry-like restoration or improvement of original functionality of products and remarket them with lower price.</td>
</tr>
<tr>
<td><strong>Recovery &amp; Recycling</strong></td>
<td>Recycle / upcycle</td>
<td>Collect and recover materials of end-of-life products and reuse them in own production.</td>
</tr>
<tr>
<td></td>
<td>Return</td>
<td>Return wasted parts and materials to the source (e.g. waste and by-products from own production).</td>
</tr>
</tbody>
</table>

Source: Accenture, Appendix 2 for more details

Did you know? On the Circular Economy site, there is an exercise package called Business model development toolkit, which helps you to identify the most relevant sub-models for your company.
Current adoption level of circular business models within the Finnish manufacturing industry is limited

<table>
<thead>
<tr>
<th>Business model</th>
<th>Sub-model</th>
<th>Adoption level</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circular Supply Chain</td>
<td>Build to last</td>
<td>Not applied at all → Widely applied</td>
<td>Products are designed for long lifecycles – however, use of modular design principles is not very common yet.</td>
</tr>
<tr>
<td></td>
<td>Circular supplies</td>
<td>Not applied at all → Widely applied</td>
<td>Input materials are mostly recyclable (e.g. steel), while use of sustainable indirect materials, such as renewable energy, varies a lot.</td>
</tr>
<tr>
<td>Sharing Platform</td>
<td>Share</td>
<td>Not applied at all → Widely applied</td>
<td>Sharing platforms are seen as challenging to implement for some products, e.g. those with fixed installation.</td>
</tr>
<tr>
<td>Product as a service</td>
<td>Product as a service</td>
<td>Not applied at all → Widely applied</td>
<td>Only a few companies have adopted the model, while many are currently exploring it.</td>
</tr>
<tr>
<td></td>
<td>Performance as a service</td>
<td>Not applied at all → Widely applied</td>
<td>Many companies are currently exploring the model, and some have never heard of it.</td>
</tr>
<tr>
<td>Product Life-extension</td>
<td>Repair &amp; Maintain</td>
<td>Not applied at all → Widely applied</td>
<td>Most companies provide at least some repair and maintenance services. However, some report that they are not leveraging their full potential.</td>
</tr>
<tr>
<td></td>
<td>Upgrade</td>
<td>Not applied at all → Widely applied</td>
<td>Many companies are already applying the model, and most others are exploring how to apply it.</td>
</tr>
<tr>
<td></td>
<td>Resell</td>
<td>Not applied at all → Widely applied</td>
<td>Companies are not seeing reselling as a relevant opportunity for products that have very long lifecycles.</td>
</tr>
<tr>
<td></td>
<td>Remanufacture</td>
<td>Not applied at all → Widely applied</td>
<td>Remanufacturing is not seen as relevant for products with very long lifecycles.</td>
</tr>
<tr>
<td>Recovery &amp; Recycling</td>
<td>Recycle / upcycle</td>
<td>Not applied at all → Widely applied</td>
<td>Companies find it challenging to ensure recycling of products, e.g., because products might be scattered around the world and companies do not have information on their final location. Furthermore, recycling is often seen as customers’ responsibility.</td>
</tr>
<tr>
<td></td>
<td>Return</td>
<td>Not applied at all → Widely applied</td>
<td>Most companies recycle some of their manufacturing waste.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

- Wärtsilä achieved **45% reduction in production development expenses**, 44% lower cost for ongoing product care and 50% reduction in assembly time using modular engine architecture.
- DESSO **increased market share by 8%** and EBIT from 1% to 9.2% in four years by producing carpets that are easy to disassemble by eliminating toxics and number of materials in carpets.
- Ecovative **reduced energy costs by 75%** compared to industry averages by developing home compostable bio-plastics based on mycelium.

### SHARING PLATFORM

| Share | Reduce warehousing costs |

- FLEXE helps companies **lower warehousing costs by 20-70%** by providing a sharing service that helps optimise usage.

### PRODUCT LIFE EXTENSION

<table>

Which capabilities are required?
Introduction to organisational requirements for circular business models
Which capabilities are required?

- When transforming from a linear to a circular value chain, new know-how regarding offerings, resource use, operations and organisation is required.
- Nine capabilities enable companies to transform their value chain to increased circularity:
  1. Design solutions to deliver customer outcomes
  2. Design products for circularity
  3. Source recycled or recyclable material
  4. Produce, remanufacture and recycle products
  5. Sell outcomes and lifecycle services
  6. Take back products at end-of-life
  7. Deploy technologies and data for delivering outcomes
  8. Orchestrate ecosystem of partners
  9. Transform mindset and steering
- The capabilities need to be developed across the organisation in several functions, including for example R&D, procurement and sales.
Moving from a linear to a circular value chain requires different capabilities

Linear chain

</tr>
</tbody>
</table>

A) Customer value delivery
- Customer engagement beyond point of sale will be required to support with product life cycle management services
- Improved understanding of customer and product requirements can be achieved through continuous interactions and data analytics

B) Resource handling
- Improved resource management is needed to do more with less
- New capabilities and mindsets are required for an improved understanding of how material selection, waste management and manufacturing services impact environmental footprint

C) Organisation and collaboration
- Use of IT and digital technologies is not enough, companies further need the ability to collect and derive valuable insights from data
- Collaboration is needed to optimise customer outcomes and value creation with partners aligned to end-to-end value creation

Source: Adapted from earlier Accenture publication, Appendix 2 for more details
Nine capabilities enable companies to transform their value chain to increased circularity

Capabilities

1. Design solutions to deliver customer outcomes
2. Design products for circularity
3. Source recycled or recyclable material
4. Produce, remanufacture and recycle products
5. Sell outcomes and lifecycle services
6. Take back products at end-of-life
7. Deploy technologies and data for delivering outcomes
8. Orchestrate ecosystem of partners
9. Transform culture and steering

Source: Adapted from earlier Accenture publication, Appendix 2 for more details

Did you know?
On the Circular Economy site, there is a capability maturity assessment, with which you can assess the capability gaps of your company and identify actions to bridge them.
Customer-centric design enables additional sales throughout the product lifecycle

A) Customer value delivery

Design solutions to deliver customer outcomes

- Ability to put customer needs and requirements at the centre of product design
  - Understanding of user journeys and needs
  - Ability to integrate digital applications into product design
  - Development of complete product lifecycle solutions and services

- Engage customers and partners in solution co-creation
  - Perform iterative design and rapid prototyping to test, fail, learn and rebound quickly
  - Manage an open ecosystem of customers and partners, and engage in open innovation
  - Use big data and develop smart products

Design products for circularity

- Ability to design products for long life cycles and sustainable material use
  - Understanding of environmental impact throughout product life cycle
  - Ability to design products that are durable, easy to repair and upgrade, and use materials sustainably

- Follow circular design principles in product design
  - Perform life cycle assessment (LCA) to understand and avoid environmental impact in design
  - Use environmental databases and tools to model environmental impact of products
  - Develop product passports to give guidance on usage throughout product life cycle

Sell outcomes and lifecycle services

- Ability to leverage customer insights in selling value-adding solutions
  - Ability to engage customers and use customer insights for sales throughout product life cycles
  - Developing new offering and pricing models for outcome-oriented solutions
  - Understanding of customer demand and changing needs across product life cycles

- Centre sales around customer outcomes throughout the whole product life
  - Allow customers to use a product against a fee or usage-based charges instead of owning it
  - Develop service and after-sales offerings for product life extension – e.g. maintenance and repair services with the help of IoT solutions
  - Leverage data insights for predictive support

Improved customer-centricity through more frequent interaction and more customised solutions
1. Design solutions to deliver customer outcomes

**Customer-centric design, digital technologies and knowledge around DPLM** are core for solution design

<table>
<thead>
<tr>
<th>Required know-how and activities</th>
<th>Guidance on customer-centric design</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Customer-centric design:</strong> Centre development process around customer needs and the functional requirements, rather than the physical device. This way innovative solutions and product-as-a-service models are promoted</td>
<td><strong>Design Thinking</strong> is a methodology for customer-centric design. It is an iterative process using a broad set of design methods (e.g. accessible through this link). The aim is to frame opportunities and innovate in close collaboration with customers and other relevant stakeholders. Through the customer interaction, Design Thinking is especially relevant when designing customer experiences and user interfaces for new solutions. Core to the methodology is to quickly move from prototypes to “minimum viable products” and reduce the lead time for development (see example approach on next page).</td>
</tr>
<tr>
<td><strong>2. Smart and connected solutions:</strong> Consider how to develop smart products using new technologies such as sensors and big data that enable to deliver better outcomes for the customer through e.g. enhanced functionality</td>
<td></td>
</tr>
<tr>
<td><strong>3. Digital product or application life cycle management (DPLM/ALM):</strong> Include the design of the complete digital life cycle into the initial design phase. The DPLM enables to speed up processes and increase efficiencies throughout the life cycle by digitising and coordinating all relevant processes connected to the solution. Product life cycle management data becomes an important part for generating insights and detecting potential new revenue streams</td>
<td></td>
</tr>
</tbody>
</table>

**Example metrics**
- # of external stakeholders (including customers) engaged
- # of days until minimum viable product is realised

**Business model relevance**

Customers, partners and employees ensure proof-of-concept through iterative testing and learnings

1. Design solutions to deliver customer outcomes

<table>
<thead>
<tr>
<th>CUSTOMERS</th>
<th>NEEDS</th>
<th>SERVICES / CAPABILITIES</th>
<th>ECOSYSTEM PARTNERS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Discover customer needs through market research (e.g. questionnaire) and customer workshop</td>
<td>• Describe circular concept in relation to customer needs and preferences 1 week</td>
<td>• Test internal capabilities to deliver concept</td>
<td>• Identify partners that can complement capabilities</td>
</tr>
<tr>
<td>• Deploy design thinking methodology to create a prototype and minimum viable product for fast market testing and iterative refinement 1 week</td>
<td>• Design concept together with customers, employees and partners through rapid prototyping</td>
<td>• Prepare required organisational changes, including capabilities, technologies and processes 4 weeks</td>
<td>• Collaborate on solution development and corporate ventures and share experience to improve concept 2 weeks</td>
</tr>
</tbody>
</table>

Piloting approach

Improved user experience and enhanced ability to deliver solution
1. Design solutions to deliver customer outcomes

**Changes in set-up and actors are required when moving from product to solution innovation**

### Changes from traditional to service innovation

<table>
<thead>
<tr>
<th>What</th>
<th>Product innovation</th>
<th>Solution innovation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Understand customer usage and expected product attributes</td>
<td>Design and live customer experience/journey</td>
<td></td>
</tr>
</tbody>
</table>

| How | Leverage traditional and robust processes | Perform iterative design and prototyping (to test, fail, learn and rebound quickly) |

| Who | Leverage companies distinctive forces and expertise around product/service | Manage an open ecosystem and perform open innovation – acquiring/partnering with new talents |

| Core skills | Draw on traditional product/service know-how | Apply design thinking and big data/analytics |

| Duration | Perform innovation cycle in years | Perform innovation cycle in weeks/months |
1. Design solutions to deliver customer outcomes

Prototyping spaces, digital acceleration centres and digitally enabled solutions are good practices

Good practices and examples

Co-creation and prototyping space
Establish a space in which companies, students and future customers can jointly develop, test and prototype new ideas.
Example: Firstbuild, a GE Appliances backed co-creation space, offers access to the latest technology to design, prototype, or put the finishing touches to inventions. It also has a virtual community on a platform proposing challenges and ideating solutions.

Digital acceleration centres
Create distinct development programmes around how digital solutions can enhance customer value.
Example: Wärtsilä established four digital acceleration centres that act as incubators for new digital ideas. The work is based on agile methodologies and involves close interaction with customers and stakeholders. In a six week “sprint” 106 different concepts were developed for the digital vessel project that then were evaluated in more detail.

Digitally enabled solution
Reflect on areas a product has impact on and the data required to add value to the customer. Ideate what means might exist to access and use this data.
Example: ZF Friedrichshafen developed a fuel-economic transmission system that knows in advance when to shift gears by analysing the topography on the basis of GPS data feed.

Enabling technologies
- Internet of Things
- Big data

Source: Company websites
Life cycle thinking and circular design criteria are key in developing circular products

2. Design products for circularity

Required know-how and activities

1. **Life cycle thinking:** Consider the whole life cycle in the design process from production to use phase to end-of-life as more than 80% of the environmental impact of a product is determined at the design stage (See guidance on the right)

2. **Circular design criteria:** Develop and apply circular design criteria such as
   - Design for a longer life through upgrading, reuse, refurbishment and remanufacture
   - Design based on sustainable and minimal resource use and enabling high-quality recycling of materials
   - Enabling cleaner material cycles through substitution of hazardous substances

See next page for more information and examples

Guidance on life cycle thinking

Minimising environmental impacts along the whole life cycle and comparing alternatives against each other are key for sustainable product design. **Life cycle assessment (LCA) is a method that allows assessing products and services,** and the process itself is described through ISO 14040 and 14044.

After defining the scope and boundaries of the analysis, the inventory and impact of products can be modelled. For this, data from **environmental databases** is available (e.g. resource depletion, CO2 emissions). Several tools from different providers exist on the market e.g. SimaPro, Umberto and GaBi

Example metrics

- % of renewable, recycled or reused material in product
- # of different components in product design

Business model relevance

- Circular supply chain: ✔
- Sharing platform: ❌
- Product Life Extension: ✔
- Recovery & Recycling: ❌
- Product as a service: ✔
### Seven aspects are relevant for circular design

<table>
<thead>
<tr>
<th>Aspects</th>
<th>How to incorporate it in product</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Design out waste</td>
<td>Use less resources for producing the product</td>
<td>Ford investigates 3D printed parts to reduce material use and weight of components</td>
</tr>
<tr>
<td>2. Design for upgrading and modularity</td>
<td>Allow exchange of components for updates or upgrades (e.g. standardise connections)</td>
<td>PuzzlePhone is built from three modular components available in different sizes and materials</td>
</tr>
<tr>
<td>3. Design for reuse, repair, refurbishment, remanufacturing</td>
<td>Allow for disassembly through using e.g. reversible connections</td>
<td>Caterpillar designs parts for manufacturing e.g. an engine block with a removable sleeve in the cylinder bore</td>
</tr>
<tr>
<td>4. Design based on sustainable resources</td>
<td>Use renewable or recycled materials</td>
<td>Renault uses recycled material for 36% of the total mass of a new vehicle</td>
</tr>
<tr>
<td>5. Design for minimal resource use along life cycle</td>
<td>Make sure product is efficient in use phase (e.g. no resource intensive supplies)</td>
<td>Outotec dry tailings water treatment plant minimises fresh water intake during its operation</td>
</tr>
<tr>
<td>6. Design enabling high-quality recycling of materials</td>
<td>Limit number of different materials, use recyclable ones and make them separable</td>
<td>Philips constructs light bulbs in a sandwich construction that assures separation upon crushing</td>
</tr>
<tr>
<td>7. Design for cleaner material cycles</td>
<td>Substitute hazardous substances in products</td>
<td>Akzo Nobel created a new coating made from plant-based oils and recycled PET bottles instead of solvents</td>
</tr>
</tbody>
</table>

Source: Company websites
2. Design products for circularity

Several companies have good practices in circular product development, such as use of modular design

Good practices and examples

**Modular design**
Design your products in a modular way to improve reparability, upgrades and other benefits

*Example:* Wärtsilä developed a modular design for the medium speed engine product family as it allows standardisation and component commonality and flexibility for variances at the same time. The design enables updating technologies, improves serviceability and reduces the lead-time for product development.

**Design guide**
Summarise all design criteria in line with company specific prioritisation in Design guide with tool kit for product developers

*Example:* Philips offers design guide for product development with CE Spider Web in which solutions are rated for Disassembly, Maintenance, Modularity, Futureproof, Recycling and Energy use ([Link to tool description](#))

**Product passport**
Document the materials used in a product and give guidance how to extract valuable parts to enable recycling at the end of a product’s life

*Example:* Maersk introduced a Cradle-to-Cradle Passport for vessels, a database listing the material composition of the main parts of the ship enabling better recycling of materials and parts. It requires input from all components’ suppliers and documents approximately 95% (by weight) of the materials used to build the ships.

Source: Company websites
5. Sell outcomes and lifecycle services

**Centre sales around outcomes for customers and provide services throughout the whole product life**

### Required know-how and activities

1. **Customer-centric sales process**: Adopt customer perspective and knowledge on their industry to understand their needs, educate them on suitable existing or personalised solutions and invite them to joint solution development.

2. **Offering and pricing models**: Develop new offering and pricing models for outcome-oriented solutions, such as performance-based models (see next page).

3. **Customer engagement throughout life cycle**: Continuously engage with customers to get deep insights on how the product is used, what issues arise and what improvement potential exists. Offer online platform for customer interaction.

4. **Product life extension support**: Provide services for product life extension such as spare parts, (remote) maintenance and repair services. Leverage data from connected products for predictive services (see guidance on the right).

5. **Service delivery**: If know-how or reach for services does not exist (yet), partner with other companies to deliver value proposition.

### Guidance on product life extension support

To support extension of product life, several after-sales services can be provided:

- DIY guidance for maintenance and repair
- Maintenance services (remote, predictive)
- Repair support with VR
- Repair service on customer site
- Repair of sent-in products – using remanufacturing capabilities
- Upgrades of software and parts

### Example metrics

- Level of customer satisfaction
- Average duration of customer relationships
- % of solutions sold (instead of product-only)

### Business model relevance

**Functions**

- Circular supply chain
- Sharing platform
- Product Life Extension
- Recovery & Recycling
- Product as a service

**Guidance on product life extension support**
5. Sell outcomes and lifecycle services

**Product as a service offering can be designed in different forms setting incentives for circularity**

### Offering models for product-service systems

<table>
<thead>
<tr>
<th>Offering</th>
<th>Ownership</th>
<th>Offering design</th>
<th>Incentives for circularity</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Product-as-a-service models</strong></td>
<td>Lies with producing company during useful life</td>
<td><strong>Operating lease</strong>: Overarching concept, in which the lessor retains ownership of the asset, while the lessee pays for its use over a certain time</td>
<td>🔫 Longevity</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Full service lease</strong>: Combines operating lease contract with additional services such as maintenance for the asset</td>
<td>🔫 Longevity, reparability and easy maintenance</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Performance-based payment</strong>: Combines operating lease with periodical fees dependent on use or delivered performance of the asset</td>
<td>🔫 Longevity, reparability, optimised use-phase consumption</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Rent</strong>: Differs from leasing in that it generally is for a shorter period. Maintenance and insurance are often included in the contract</td>
<td>🔫 Longevity, reparability and easy maintenance</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Finance lease</strong>: All the risks and rewards connected to ownership of an asset is transferred to the lessee during time of lease (e.g. cost for maintenance, repair, resource use during use phase). At the end of the leasing contract, the ownership of the asset is passed over to lessee</td>
<td>No circularity incentives</td>
</tr>
</tbody>
</table>

- Deep dives
Leading companies show how to use new pricing models and apply digital technologies

Good practices and examples

New pricing models
Develop new pricing models that allow offering solutions based on the value and outcome they deliver to the customers.

Example: Philips extends its offering and provides light as a service complementary to its offering of light bulbs. The pricing schemes used are either paying per lux or paying a fixed charge per month. The service delivers the value to the customer in a whole new way. To provide it as efficient as possible, equipment is tracked with sensors.

Customer-centric sales process
Use e.g. virtual reality in marketing and offer an app in which customers can configure products, have it displayed in their environment and seamlessly place an order.

Example: BMW developed a virtual reality marketing app in which customers can compile the car they would like to buy, see interior in a 360° view and have it shown in e.g. their own car park.

Product life extension support
Integrate sensors into product to monitor status and allow remote checks to prevent breakdowns.

Example: Rolls Royce provides a suite of predictive maintenance and repair services for its jet engines, including monitoring engine health and modifying engines to increase reliability and durability.

Enabling technology

- Internet of Things
- Virtual Reality

Source: Company websites
Appropriate resource handling ensures that materials and products are kept in a closed cycle

### B) Resource handling

#### Source recycled or recyclable material

**Ability to specify and source materials that can easily be regenerated and recycled**
- Understanding of circular material properties and qualities
- Development of KPIs that promote circular thinking throughout procurement process
- Ability to engage suppliers and develop ecosystem partnerships

**Access circular materials from new sources:**
- Collection infrastructure & external take-back
- Industrial symbiosis
- Source marketplace platform
- Waste company partnership
- Commodity market for secondary materials

#### Produce, remanufacture and recycle products

**Ability to handle waste in production, incl. material flows and remanufacturing**
- Material flow management
- Digital production for new levels of efficiency
- Repair and remanufacture returned products
- Treatment capabilities to recycle material

**Integrate technologies to monitor and track material and product flows**
- Track production process and materials with RFID tags, Machine vision and AI
- Automatically sort materials (e.g. robotics)
- Assess performance and address only faulty functionality and components

#### Take back products at end-of-life

**Ability to establish return systems that ease and facilitate disposal of end-of-life products**
- Design and establish reverse logistic network
- Monitor and assess product performance
- Establish return incentives

**Adapt programmes and approach based on secondary values of products**
- Define return specification based on economic value case
- Optimise returns, e.g. collaboration with dealers, workshops, stores and collection at premises

Improved management of resources to maximise returns on embedded values across product-life cycle
Circular sourcing reduces wasted value by matching required inputs with available circular material

Required know-how and activities

1. **Circular materials and equipment:** Make products/equipment that are produced following circular (design) criteria preferred choice for procurement. Source circular materials such as material for reuse or recycled material. To evaluate suitability of material as input, deep understanding of materials properties is required (e.g. quality requirements)

2. **Procurement process modification:** Integrate circular thinking into procurement process, e.g.
   - Consider total cost of ownership for goods
   - Include circular economy in Requests For Proposals and Supplier Code of Conduct
   - Use environmental KPIs such as carbon intensity as additional decision criteria in buying decision

3. **Supplier engagement:** Develop supplier network into ecosystem and e.g.
   - Establish a bidirectional dialogue on required materials and available by-products
   - Share knowledge on circular economy and other environmental practices

How to source circular materials?

- Establish collection infrastructure or draw on external take-back systems\(^1\) and build or source treatment capabilities\(^2\)
- Engage in industrial symbiosis
- Participate on resources marketplace platform
- Establish waste company partnership to source treated material
- Source resources on commodity market

Example metrics

- % of spend on circular materials
- % of key suppliers participating in supplier engagement programme
- % reduction in material cost

Business model relevance

![Circular supply chain](✓)  
![Sharing platform](✗)  
![Product Life Extension](✗)  
![Recovery & Recycling](✗)  
![Product as a service](✓)

---

1. Please see capability 6 “Take back products at end-of-life” if done internally, 2. Please see capability 4 “Produce, remanufacture and recycle products” if done internally
3. Source recycled or recyclable material

Circular resource marketplace platforms and industrial symbiosis can transform material sourcing

Good practices and examples

Circular resource marketplace platform
Participate on a platform that facilitates matching of required and available materials for recycling or reuse of different companies or engage in its development

Example: Excess Materials Exchange is a pilot of a digital facilitated marketplace run by a Dutch start-up. Companies from all industries can share information on the material they want to exchange, and receive information on the value, alternative uses for/ sources of secondary materials, and environmental impact. The platform uses an Artificial Intelligence engine connecting to data of thousands of scientific papers and patents

Industrial symbiosis (IS)
Develop symbiotic partnerships with cross-industry actors designing “waste as input” streams

Example: Kalundborg (Denmark) – Collaboration with 8 private and public partners started in 1970s. Has about 50 symbiotic exchanges such as steam, water, or specific flows. An example for a specific flow is Novo Gro30, biomass from pharmaceutical production that is then used as fertiliser, for wastewater treatment and biogas production

Enabling technology

- Artificial intelligence
- Big data

Source: Company websites
3. Source recycled or recyclable material

Using shared services and asking suppliers to apply circular principles are good practices in sourcing

### Good practices and examples

#### Shared services and equipment
Realise cost reduction by sharing production equipment and services

*Example:* Instead of buying an own 3D printer, companies can use the platform [3DHubs](Link) for 3D printing and CNC machining ([Link](Link)) or source the service from providers such as [UPS](Link) ([Link](Link))

#### Circular economy in supplier code of conduct
Promote circular economy in your supplier relationships through stating its importance in the code of conduct

*Example:* HP includes circular economy aspects into its Supplier Code of Conduct with the following statement: “Suppliers shall implement a systematic approach to identify, manage, reduce, and responsibly dispose of or recycle solid waste (non-hazardous) and waste water.”

---

### Enabling technology

| 3D printer |  |

Source: Company websites
Aim for material flow transparency in production and add remanufacturing know-how to skill-set

**Required know-how and activities**

1. **Material flow management:** Closely monitor and manage material flows on-site in production. Follow principles of prevent, reuse, recycle, recover and dispose. Try to keep materials separate to enable high-quality recycling.

2. **Digital production technologies:** Unlock new levels of production efficiency through digital technologies such as sensors and big data that identify and predict maintenance issues. Facilitate tasks for workforce through wearables and improved machine-human interactions moving towards a digital plant.

3. **Remanufacturing:** Develop skill and infrastructure required to sort, repair and remanufacture returned used products and components.

4. **Reprocessing and recycling:** Build treatment capabilities to reprocess and recycle material from returned products or production waste.

**Guidance on remanufacturing process set-up**

1. **Check-in:** Confirm that the returned part is valid for remanufacturing process through digitised quality analysis and the serial number and update status in system as “returned”. This process can be supported by use of RFID tags, Machine vision and AI.

2. **Sorting:** Sort the returned parts to identify whether they need to be refurbished, repaired, remanufactured or go into recycling. Define decision rules for process. Update data in inventory.

3. **Remanufacturing:** Repair, refurbish and remanufacture the part. Conduct quality check in the end to guarantee function.

Depending on the return scheme, Step 1 and 2 could take place offsite during the take-back phase by e.g. service provider or dealer.

**Example metrics**

- % of waste recycled / % of waste sent to landfill
- % of wasted materials from production recovered
- # of parts remanufactured / % of returned parts remanufactured

**Business model relevance**

- Circular supply chain
- Sharing platform
- Product Life Extension
- Recovery & Recycling
- Product as a service
4. Produce, remanufacture and recycle products

To raise resource efficiency, use 3D printing, keep waste separated and introduce remanufacturing

Good practices and examples

**3D printing**
Boost product quality and help reduce the need for a spare parts inventory

*Example: Volvo Trucks produces tough manufacturing and assembly tools in 94% less time with 3D printing*

**Production waste separation**
Integrate waste management in production process and keep waste material flows separate to enable high quality recycling

*Example: Ford engages with suppliers to recycle aluminium scraps from car production (e.g. stamping windows into body panels). To achieve the required level of purity, Ford invested in machinery to separate, clean and shred aluminium*

**Remanufacturing capabilities**
Develop remanufacturing capabilities to sort and repair returned equipment to extend their life cycles

*Example: Various models of Scania trucks are dismantled and remanufactured at Scania Vehicle Recycling. Parts such as engines, gear boxes and differentials are inspected and adjusted internally. They are sold through local Scania workshops and distributed via the daily spare parts routine of Scania Parts Logistics*

Source: Company websites
Return flow management requires a take-back programme, product tracking and return incentives

Required know-how and activities

1. **Take-back programme**: Develop a programme that enables customers to return products at the end of their useful life. Design and establish a reverse logistics network for this. Criteria to consider for the design are e.g. price, size of product, and frequency of exchange (see guidance on the right).

2. **Tracking and monitoring**: Track and monitor condition of product in its life cycle by applying connected sensors and analytics.

3. **Return incentives**: Incentivise product return through e.g. deposits, or establish a reverse logistics chain – either in-house or through partners.

Guidance setting up a take-back programme

Take-back programmes are suitable for
- Products with high end-of-life value
- Companies with low costs for reversed logistics

To assess suitability...
- ... estimate economic value of product that is to be returned as the difference between price on market and costs for remanufacturing. The remaining share of revenue needs to cover return and set-up costs for the programme
- ... estimate cost of return by exploring different take-back options (through e.g. dealers, workshops, stores or direct collection at premises) operated internally or sourced from special providers.

Example metrics
- % of sold items returned
- Cost per item returned
- Days required for return flow

Business model relevance

- Circular supply chain
- Sharing platform
- Product Life Extension
- Recovery & Recycling
- Product as a service

Functions

- Design / R&D
- Sourcing & Procurement
- (Re)manufaturing
- Sales
- Aftersales
- Take-back
- Recycling
- Strategy & Leadership

Example metrics

- Deep dives
### Good practices inspire ways to incentivise product return, develop reverse logistics and manage waste

#### Incentivise product return
Provide incentives for customers to return products or components through e.g. refunds and discounts

*Example:* Caterpillar uses a proprietary core management system to globally manage core returns from dealers and Caterpillar inspection facilities and determine the core credit amounts that will be refunded

#### Reverse logistic channels
Develop own reverse logistic channels or partner with established companies to collect components and complete products

*Example:* CoremanNet, a subsidiary of Bosch, offers qualified core return solutions for the automotive spare parts market. The modular packages can be adapted to individual company requirements

#### Waste material management
Control waste material flows to secure high-quality material for recycling

*Example:* Renault tries to maintain control over the flow of automotive waste materials and parts through its subsidiary Renault Environnement that e.g. coordinates >300 demolishers in France

---

**Source:** Company websites
Technology, partners and leadership play a key role in the circular transformation

C) Organisation and collaboration

### Deploy technologies and data for delivering outcomes

**Required know-how**
- Ability to collect, manage and derive valuable insights from technologies and real-time data
  - Development and management of IT infrastructure and APIs
  - Data collection, analytics, visualisation and monetisation
  - Understanding of existing and new data and security regulations

**Leverage tools to generate and visualise data**
- Deploy sensors and other data collection tools, and develop smart products to generate data
- Use data to reduce costs and generate revenues
- Use visualisation tools to draw conclusions (e.g. Tableau, Microsoft Power BI and IBM Cognos)

### Orchestrate ecosystem of partners

**Required know-how**
- Ability to manage increasing number of ecosystem partners to jointly close the loop
  - Understanding of how to maximise the strengths of each partner
  - Deriving new ideas through co-innovation and input from a variety of sources
  - Understanding of IPR\(^1\) and legal compliance

**Harness existing network of partnerships and use digital platforms for interactions**
- Join knowledge sharing platforms (e.g. WBCSD, CE100 from Ellen MacArthur foundation and DIMECC Ltd)
- Build digital platforms to connect to stakeholders and to gain insights

### Transform culture and steering

**Required know-how**
- Ability to develop and motivate circular competences and outcomes
  - Enablement of cultural shift and cross-functional collaborations
  - Development of targets and metrics to incentivise circular initiatives
  - Understanding of life cycle perspectives for accurate business valuation

**Integrate circular economy objectives and organise around products/services to drive cross-functional collaboration**
- Define clear and measurable targets
- Facilitate exchange of information and cross-functional collaborations
- Motivate employees to change mindset

---

\(^1\) Intellectual Property Rights

---

Successful transformation through full utilisation of internal and external strengths and resources
Know-how in IT is key for digitally enabled circular solutions and seamless integration with ecosystem

Required know-how and activities

1. **Data infrastructure set-up**: Develop the IT infrastructure of the company. A seamless integration of different technologies, databases and partners need to be in place for digitally enabled outcome-oriented offerings and resource efficient production. Management and integration of APIs (Application Programming Interfaces) is required for this.

2. **Data collection, analytics and visualisation**: Draw insights from historic and real-time data from e.g. smart products through data analytics and visualisation to facilitate new offerings such as predictive maintenance. Use and develop tools for collecting data from customers, e.g. apps for reporting product malfunction.

3. **Monetising data**: Use data from business operations and smart products to reduce cost and develop new revenue streams (see guidance on the right).

4. **Data privacy and security**: Ensure compliance with data privacy regulation and secure all data transactions internally and in exchange with customers.

Guidance on data monetisation

Manufacturing companies can monetise data by:

a) Reducing cost (focus on data from own operations)
   - Analyse historic data to identify structural inefficiencies
   - Analyse real-time data to detect incidents

b) Increasing revenue (focus on data from smart products):
   - Draw insights from historic use phase data to develop new offerings and products (see example on next slide)
   - Use real-time use phase data to deliver services during the use phase, such as predictive maintenance
   - Sell anonymised data to interested third parties supporting their services e.g. data on weather condition

Example metrics

- % of source data is accurate/ reliability level of source data
- Amount of historical data for analysis and algorithm reliability
- % increase in responsiveness to specified actions/ decisions

Business model relevance

- Circular supply chain
- Sharing platform
- Life Extension
- Recovery & Recycling
- Product as a service

Functions

- Design / R&D
- Sourcing & Procurement
- Manufacturing
- Sales
- After-sales
- Take-back
- Recycling

Strategy & Leadership
7. Deploy technologies and data for delivering outcomes

**Good practices include deploying technologies and drawing insights from generated data**

### Good practices and examples

#### Tech-enabled outcome orientation
Deploy sensors and develop smart products to generate data-enabled new business models

*Example: Michelin introduced the first “Tire Monitoring Management System” for mining tires enabled through sensors in the tires recording and transmitting pressure and temperature*

#### Data monetisation
Use data insights to reduce costs or generate revenue e.g. through predictive maintenance internally or provided as a service to customers

*Example: Siemens models status of gas turbines with about 500 sensors in a turbine, and uses data to simulate operation while AI is simulating wear and tear of components to prompt maintenance measures to prevent downtime. Insights can be shared via cloud*

#### Data visualisation tools
Use data analytics and visualisation tools to extract insights from the pool of available data

*Example: Available plug-and-play tools are for example Tableau, Microsoft Power BI or IBM Cognos*

### Enabling technology

- **Internet of Things**
- **Artificial intelligence**
- **Big data**

Source: Company websites
8. Orchestrate ecosystem of partners

To orchestrate the ecosystem, identifying and engaging stakeholders, and IPR management are key

Required know-how and activities

1. **Coordination of ecosystem partners**: Facilitate combining efforts to jointly generate circular value from closed loops, new services etc. Have oversight of different partnerships established in procurement, sales and support to identify synergies.

2. **Engagement to co-innovate**: Harness ecosystem for co-innovation and obtain and develop ideas for new products or services from a wide variety of sources, both internal (employees) and external (customers, suppliers, market research) to the firm.

3. **Intellectual property rights (IPR)**: Secure own IPR and assure legal compliance in ecosystem collaboration and co-innovation (see guidance on the right).

Guidance on managing IPR in open innovation

1) Develop inventory of own IP assets and maintain it

2) Set-up non-disclosure agreements with partners to secure confidentiality in discussions and negotiations prior to an official collaboration, or embed it into a memorandum of understanding.

3) Sign a jointly developed consortium agreement defining responsibilities, listing ownership of existing IPs and allocating ownership and access of newly generated IP.

Helpful tools and resources are available at the European IPR helpdesk online ([Link](#))

Example metrics

- # of ecosystem partners at each stage of product life cycle
- # of ideations with eco-system partners

Business model relevance

- Circular supply chain
- Sharing platform
- Product Life Extension
- Recovery & Recycling
- Product as a service
Harness existing networks and partnerships and use digital platforms for interaction

Good practices and examples

**Knowledge sharing networks**
Join existing knowledge sharing platforms to leverage existing experiences and share own ones

*Example: Factor 10 from WBCSD and CE100 from Ellen MacArthur Foundation* are initiatives that aim to accelerate the transition to a circular economy by bringing together companies from different sectors. Both organisations also publish CE content on their website, which is also available for non-member organisations.

**Cross-sector partnerships**
Connect with stakeholders that have a similar mission and vision. To develop data-based solutions, cross-sector collaborations are required

*Example: DIMECC Ltd launched the “Intelligent Industry Ecosystem” in December 2017, where Finnish companies create new data-based products and services. The ecosystem currently involves 10 companies, including e.g. Cargotec, Fastems, Konecranes, Nokia and Ponsse* (Link)

**Digital platforms**
Build a platform to connect relevant stakeholders, collect ideas and find solutions

*Example: Dell established the collaboration platform IdeaStorm for ideation and real-time product portfolio management*
9. Transform mindset and steering

Build the capability to manage the transformation at the right pace

Required know-how and activities

1. **Circular economy competencies**: Build, maintain and expand circular economy know-how to train and support the organisation

2. **Culture and workforce**: Motivate employees and enable culture shift to embrace cross-functional collaboration, ecosystem thinking and customer-centricity. Show leadership commitment, have transparent and engaging communication and conduct trainings

3. **Steering mechanisms**: Develop targets and metrics to promote and incentivise circular capabilities and products. Set incentives for employees to drive circular initiatives. Develop process to account for metrics and track development over time

4. **Circular business case**: Adapt a life cycle perspective for business valuation and add qualitative indicators for intangible benefits

Guidance on steering mechanisms

Performance indicators and connected incentives need to be forward-looking and consider development over time, for example:

- **Design**: Life cycle emissions [e.g. CO2 volume]
- **Sourcing**: % of input coming from virgin vs recycled materials
- **Manufacturing**: % of reused materials / components
- **Sales**: Customer lifetime value [€]
- **Take-back**: % of recovered assets

Example metrics

- # of trainings held
- % of variable salary connected to circular transformation

Business model relevance

- Circular supply chain
- Sharing platform
- Product Life Extension
- Recovery & Recycling
- Product as a service

Functions

- Design / R&D
- Sourcing & Procurement
- (Re-)manufacturing
- Sales
- Aftersales
- Take-back
- Recycling
- Strategy & Leadership
9. Transform mindset and steering

The transformation requires new targets, cross-functional collaboration and culture change

Good practices and examples

Target setting
Integrate circular economy objectives into company target(s) to demonstrate their importance and your company’s commitment

Example: Siemens has a corporate zero-waste to landfill target.

Unilever sets multiple targets for different waste categories (Link to example targets).

Cross-functional collaboration
Facilitate exchange of information and joint solution development between different functional units of the business e.g. product development and sourcing

Example: Danone embraced circular economy in its organisational structure by developing cross-divisional, cross-functional internal units for its core materials used in production (i.e. milk, water and plastics).

Culture change
Acknowledge that a transformation is required and actively support the organisation to unfreeze its current status, trigger mindset shift and ensure employees internalise it for good

Example: Philips CEO Frans van Houte is guiding his company to redesigning its products and considering how to capture their residual value. At the same time it is shifting from a transaction- to a relationship-based business model – that entails closer cooperation with customers and suppliers.
The capabilities need to be developed from several functions – one function takes the lead for each capability

<table>

Legend: ✔️ Key capability  ✔️ Supporting capability
Not all capabilities have to be build internally, ecosystem partners can support

1. Design solutions to deliver customer outcomes
   - Providers of digital technologies
   - Companies supporting on digital product life cycle management
   - Designers for customer centric and digital design

2. Design products for circularity
   - Companies and universities with knowledge on e.g. circular materials
   - Designers assisting circular design

3. Source recycled or recyclable materials
   - Raw material suppliers that already have circular economy initiatives
   - Recycling companies
   - Renewable energy companies

4. Produce, remanufacture and recycle products
   - Providers of innovative production or remanufacturing technologies (e.g. robotics, 3D printing, artificial intelligence)

5. Sell outcomes and lifecycle services
   - Partners that can assist in identifying customers (e.g. via Business Finland’s search)
   - Providers of sales intelligence and customer platforms

6. Take back products at end-of-life
   - Logistic companies to jointly develop return scheme or draw on existing services
   - Companies with specialised return logistics offering

7. Deploy technologies and data for delivering outcomes
   - Technology providers for e.g. IoT solutions
   - Data-analytics companies and tools that help both gather and analyse data

8. Orchestrate ecosystem of partners
   - Knowledge and experience sharing networks and platforms
   - Public programs on circular economy

9. Transform mindset and steering
   - Companies promoting transparency and reporting
   - Networks offering guidance and good practices on transformation

Illustrative examples:
- Technical providers for e.g. IoT solutions
- Data-analytics companies and tools that help both gather and analyse data
- Knowledge and experience sharing networks and platforms
- Public programs on circular economy
- Companies promoting transparency and reporting
- Networks offering guidance and good practices on transformation

Which technologies can support?

Overview of enabling technologies
This chapter will help you to:
• Explore technologies that can enable your selected circular business model(s)
• Assess your technology maturity and identify actions to develop necessary applications and tools
• Identify potential technology partners and suppliers

CHAPTER SUMMARY
Which technologies can support?

• The digital reinvention of industry (Industry X.0) can deliver tangible benefits and enable the move towards circular economy in the manufacturing industry
• Industry X.0 summarises the rapid development of digital, physical and biological technologies, providing levers for circularity
• Companies can draw on a set of 19 technologies that are applicable for different use cases and circular business models
• To assess the viability of technology implementation, price development, scope of application, comparability of technologies and their benefits need to be considered
• Finally, it is important to note that some new technologies come with risks that need to be balanced with their benefits

Supporting tools:
• Technology maturity assessment
The availability and use of technology can enable the move towards circular economy in the manufacturing industry

“Information is at the heart of ensuring that businesses around the world can make the right decisions to eradicate waste and use resources effectively. The internet of things, with its smart sensors and connected technologies, can play a key role in providing valuable data about things like energy use, under-utilised assets, and material flows to help make businesses more efficient.”
Kate Brand, Lead for Sustainability, Google Inc.¹

Entries to The Circulars, the world’s premier Circular Economy award, are all tech-enabled
100% of entries to “The circular” awards 2018 identified either a digital, physical or biological technology as part of their circular economy strategy – 51% were digital (e.g. Big Data and Machine Learning)²

Price development makes technology accessible for SME
“Predictive maintenance in performance contracts is not a novel development at the enterprise level. However, recent technological development increasingly enables performance models to trickle down to small and medium-sized enterprise (SME) customers where previously the tracking and logistics were prohibitively costly” as a report of the World economic forum points out.³

“Truly circular economies arguably cannot exist without the Internet of Things. No amount of clever design ensures a complex system will remain useful and efficient over time. To be sustainable, a system must be responsive; actions and behaviours must be connected via data and knowledge.”
Tim Brown, CEO of IDEO⁴

“With the advent of the 4th industrial revolution, we have a suit of innovations and technologies that can enable resource decoupling, yet we still live in a world where natural resource demand is growing dramatically.”
Dominic Waouhra, Member of the Executive Committee, World Economic Forum⁴

Sources: 1: Ellen Macarthur Foundation 2: Accenture analysis; 3: World Economic Forum; 4: Circle Economy
The increasing speed of technology development forms the term Industry X.0, referring to technologies used tomorrow.
Changes through Industry X.0 deliver tangible outcomes for companies

Industry X.0 changes

• Invent new **smart connected products and services**
• Transform business models and operations from **product to service to outcome-driven solutions**
• Enable companies to create and participate in **new ecosystems**
• Design the best **experiences for consumers and employees**
• **Automate** core processes of R&D, engineering, production and support
• Integrate systems and digital data footprint to create a **digital thread** through the product journey
• Apply **next generation production techniques** - 3D printing, robotics etc.
• Connect machines and sensors, and **extract data and derive intelligence** to improve performance

Outcome for companies

• **New revenue streams** from as a service and smart connected products
• **New product innovation & design**
• **Personalised customer experiences**
• **Better employee experiences** and productivity for both B2C and B2B
• **Faster time to market** from smarter processes and leading technologies
• **Increased R&D efficiency** by lean, agile methodologies
• **Greater agility and responsiveness** to demand
• **Dramatically reduced cost** with data driven insights

Source: Adapted from earlier Accenture publications, Appendix 2 for more details
Besides digital technologies, physical and biological technologies develop at rapid pace, enabling circularity.

Level of technology development

- **Emerging**
  - Price for robot arms dropped from 2014 to 2017 about 25% and will further decrease by 22% until 2025
  - Robot arms enable automation of routine processes such as sorting

- **Improving**
  - By 2020, cost of IoT sensors will have decreased by 70% from 2004
  - Sensors enable circular economy by e.g. recording real-time data from operations for predictive maintenance

- **Maturing**
  - Global spend on 3D printing (infrastructure and service) is estimated to grow about 20% annually until 2021 from $12bn in 2018 to 20bn
  - 3D printing e.g. decreases costs for rare spare parts, enabling repair of products

- **Scale-up**
  - Constantly advancing digital infrastructure (e.g. Edge / Fog Computing, Cloud, Scalable API)

**Did you know?**
On the Circular Economy site, there is a [technology maturity assessment](#), with which you can assess the maturity of your company in technologies enabling circularity, and identify actions to develop it.
RFID, Secondary data and Augmented reality are digital technologies enabling circular economy

<table>
<thead>
<tr>
<th>Technology</th>
<th>Description and circular economy example</th>
<th>Illustrative CE Value driver</th>
<th>Business model relevance</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Radio-frequency identification</strong></td>
<td>Enables wireless communication of data between a network-connected reading device and a tag on which data is stored. Exchange is activated by the waves from the reading device. Example: HID offers RFID tags used for stock management, sorting and tracking applications.</td>
<td>Enables product identification throughout life cycle.</td>
<td>Saves time, efforts and costs related to data collection.</td>
</tr>
<tr>
<td><strong>Secondary data</strong></td>
<td>Use of already existing data, such as social media comments, images, temperature measurements, and open data to draw insights on products and customer preferences. Example: SKF is measuring oil temperature to analyse bearing condition and performance, while Pandora’s customers are posting pictures of second hand jewellery to assess their suitability for resale.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Augmented Reality/Virtual Reality</strong></td>
<td>Provides interactive fully immersive digital reality in a computer generated or video enabled environment (VR) or superimposes real world with text, sounds, graphics on top of the physical world via wearables (AR). Example: ThyssenKrupp enables the field service engineers repairing elevators with HoloLens displaying virtual models of the elevator, information on prior services and repair guidance.</td>
<td>Avoids or significantly reduces costly maintenance work.</td>
<td></td>
</tr>

</tr>
</thead>
</table>
| **Big Data**              | Computationally analyses extremely large data sets to reveal patterns, trends, and dependencies  
**Example:** Alstom uses big data to operate predictive maintenance tools that are able to monitor the health of trains and infrastructure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Enables descriptive and predictive analytics | ![Checkmark](checkmark.png) ![Trash](trash.png) ![Checkmark](checkmark.png) |
| **Internet of Things/Industrial Internet** | Deploys wireless devices with embedded sensors that interact and trigger actions  
**Example:** SKF INSIGHT technology applied in railway and wind industry enables rotating machinery to communicate data on operating conditions to Cloud from which customers can extract information through a remote diagnostic service and receive reports and warnings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Enables exchange of data generated in sensor network and triggering of action | ![Checkmark](checkmark.png) ![Trash](trash.png) ![Trash](trash.png) ![Checkmark](checkmark.png) |
| **Machine learning**      | Enables machines to perform new tasks after being trained using historic data sets  
**Example:** Siemens deploys machine learning in gas turbine control systems to optimise turbine emissions. The system is able to further reduce emissions by an additional 10-15% after experts’ optimisation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Enables predictive analytics through algorithms and optimisation | ![Checkmark](checkmark.png) ![Trash](trash.png) ![Checkmark](checkmark.png) ![Checkmark](checkmark.png) |

Machine vision, Blockchain and Conversational systems are also enabling digital technologies

<table>
<thead>
<tr>
<th>Technology</th>
<th>Description and circular economy example</th>
<th>Illustrative CE Value driver</th>
<th>Business model relevance</th>
</tr>
</thead>
</table>
| Machine vision           | Provides a computing device with the ability to acquire, process, analyse and understand digital images, and extract data from the real world.  
  Example: A stamping technology manufacturer uses machine vision in quality control to prevent shipment of defective stampings.                                                            | Processes pictures for quality control or automated waste sorting                             |  
  ✓  
  ✓  
  ✓  |
| Blockchain               | Uses transaction digital ledgers that are shared by all parties participating in an established, distributed network of computers to enhance transparency and secure information sharing as the data is auditable, unchangeable and open.  
  Example: Provenance allows users to create and store a digital record of assets for anything of value to track it throughout supply chains.                                      | Enables transparency and traceability in supply chain                                          |  
  ✓  
  ✓  
  ✓  |
| Conversational System    | Uses human voice and gesture recognition to trigger actions.  
  Example: Boeing uses voice control in manufacturing processes to enable employees to receive data displayed on their virtual reality glasses without having to take hands off their work.                                     | Facilitates assembly and remanufacturing process                                                |  
  ✓

Source, descriptions: WEF, Appendix 2 for more details
Source, examples: Company websites
To assess the viability of implementing any technology, four aspects need to be considered

Price development

Price for digital technologies is decreasing over the years due to fast pace of technological development

- By 2020, cost of IoT sensors will have decreased by 70% from 2004
- Price for Robot arms dropped about 25% between 2014 and 2017 and will further decrease by 22% by 2025

Comparability

Comparing costs of different technologies for prioritisation purposes is misleading as they come with different applications and benefits

- Prices for technologies are only comparable if they deliver the same function
- Compare benefit of technologies to the company for prioritisation

Scope dependency

Costs for implementation are highly dependent on the scope

- Depending on the scope of technology application (size of operation facilities, complexity of products, number of processes), the required units/ the size of equipment will vary (e.g. robot arms: €20k-350k)

Business case

Whether the price for a technology implementation makes economic sense or not, depends on the achievable revenues/cost savings potential

- Robotic process automation increases speed of process and can save 20-50% of costs
- Combining technologies can increase benefits. Deploying Robotics, 3D printing, AI, Big data and Blockchain in industrial equipment can save e.g. €35k per employee

Sources: 1: Bank of America; Merrill Lynch, 2: IEEE Engineering360, 3: Capgemini, 4: Accenture, Appendix 2 for more details
The new technologies come with risks that need to be balanced with their benefits

Environmental risks

**Harmful production**

Even though beneficial in use phase, the production of environmentally friendly technologies can have severe negative environmental impacts (e.g. mining process of rare earth elements)\(^1\)

**Uncertainty of impact**

The (eco)toxicological risk and impact of some innovative materials is not clear upon first application and regulations are missing – as is the case of nanotechnologies. Existing studies point to potential adverse effects on aquatic and possibly other organisms\(^2\)

**Recycling challenges**

An inkjet 3D printer can waste up to 40% of its ink. In addition, depending on the material used, this waste can not be easily recycled\(^3\)

**Additional consumption and waste**

Around half a trillion connected devices by 2025 will result in additional waste, emissions and resources (including rare-earth elements) inherent in adding sensors, memory, and wireless\(^4\)

Digital risks

**Misuse of data**

Data protection is of high public concern. The European General Data Protection Regulation now makes protection of EU residents’ data for collector and processor mandatory. Sanctions of up to €20mn/ 4% of global revenue can be imposed\(^5\)

**Data breaches**

The average size of data breaches is 24,000 records and cost >$3mn based on costs of $141 for each stolen or lost record containing sensitive and confidential information\(^6\)

**Cyber attacks**

Over the last 5 years, average costs of cyber attacks have risen by 62%, mainly because of the time it takes to resolve them. While malware take about 6.4 days, malicious codes can take 55.2 days to resolve\(^7\)

**Intellectual property protection**

Open collaboration and connecting with ecosystem partners e.g. through IoT makes handling intellectual property protection more complex – software is e.g. excluded from the scope of patents in EU (different to US)\(^8\)

How to design the transformation journey?

Guidance on steps to take advantage of a circular economy and overcome barriers
How to design the transformation journey?

- The transformation journey required to leverage the circular advantage has two key elements: I) Envision and plan and II) Deliver and adapt
  
  I. Envision and plan describes the planning process in five steps from defining the vision, screening business opportunities, sizing value and assessing capability gaps to designing the roadmap
  
  II. Deliver and adapt focuses on the actual implementation. Circular transformation requires a fundamental shift across organisations, ecosystem of partners, and customers
  
- Typically, companies undergo three different stages where they first “Explore & shape” concepts for target business models, look for partners, design and test prototypes. They then “Attract & win” as they develop required processes and partnerships and pilot new solutions. Finally, they “Scale fast & keep growing” by adopting multiple circular business models across their operations and value chain
  
- Companies often face barriers along the transformation journey, typically related to (a) organisation & culture, (b) ecosystem and (c) finance
  
- To overcome barriers, companies need to promote a customer-centric, outcome-oriented and collaborative culture, understand funding requirements for circular initiatives and develop an ecosystem of partners

**Supporting tools:**
- Culture gap analysis
- Ecosystem partner identification
- Funding requirements analysis
- Roadmap development

**CHAPTER SUMMARY**

This chapter will help you to:

- Understand the key steps, common barriers and success factors on the circular transformation journey
- Identify actions to be implemented in terms of culture, ecosystem partners and financing, to avoid typical pitfalls
- Design a transformation roadmap with concrete next steps, responsibilities and milestones
The transformation journey has two key elements: I) Envision and plan and II) Deliver and adapt

Envision and Plan
Develop a vision of how your company will exploit the circular economy opportunities and plan the required changes

Deliver and adapt
Implement changes to transform offering, modify processes, develop ecosystem and become a circular business. Evaluate results and adapt plan as required
# Five steps are critical to envision and plan a successful transformation

## Envision and Plan

<table>
<thead>
<tr>
<th>Step</th>
<th>Activity</th>

</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>Why: Define vision for circular economy</strong></td>
</tr>
<tr>
<td>2</td>
<td><strong>What: Screen opportunities and size value</strong></td>
</tr>
<tr>
<td>3</td>
<td><strong>Assess capability gaps</strong></td>
</tr>
<tr>
<td>4</td>
<td><strong>Assess technology gaps</strong></td>
</tr>
<tr>
<td>5</td>
<td><strong>How: Design roadmap</strong></td>
</tr>
</tbody>
</table>

### Key activities

1. **Vision**
   - Define aspirational description of achievements in mid- and long-term future

2.1 **Business models**
   - Assess potential of circular business models to address inefficiencies

2.2 **Value proposition**
   - Develop high level description of the value proposition for new products and services

2.3 **Value case**
   - Assess potential revenues, costs and investments for selected business models

3 **Capability gap assessment**
   - Understand and analyse internal capabilities

4 **Technology assessment**
   - Evaluate opportunities of technologies

5.1 **Barriers**
   - Identify potential internal and external implementation barriers and activities to mitigate them

5.2 **Implementation**
   - Define the roadmap to implement target business model

---

**Chapter 1**

**Chapter 2**

**Chapter 3**

**Chapter 4**

**Chapter 5**

86
The transition from the traditional to the new business model is gradual and has three phases

Deliver and Adapt

Phase I: Explore & Shape
Develop concepts for target business models, look for partners, design and test prototype(s)

Phase II: Attract & Win
Develop processes and partnerships and pilot new solution to convey benefits

Phase III: Scale fast & keep growing
Adopt multiple circular business models across own operations and value chain

Source: Accenture, Appendix 2 for more details
In each phase, customer value delivery, collaboration and resource handling follow circular business logic

<table>
<thead>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Did you know?
On the Circular Economy site, there is a tool called Roadmap development, which supports you in planning your circular transformation journey.
First, a dedicated project team contributes to the pilot and stakeholders are engaged selectively

**Description**

- New solutions are developed in a customer-centric approach, analysing their needs and pain points and engaging them in the development process.
- The solutions are prototyped and tested with the customers to assure fit.
- The business model is not yet changed in this stage. A dedicated project team within the company contributes to the prototype.
- Company boundaries are opened to selected stakeholders. Customers and potentially required partners are invited to contribute and take part in the development and take an active part. This way the developed prototype matches customer needs and demand as well as possible.

**Example: Michelin Case**

- Michelin embarked on the journey to transform from a product-sales focused company towards a solution provider.
- To achieve the goal to increase sales of one of its segments from €300mn to €3bn over a period of 10 years, innovative solutions to complement the portfolio were required.
- In the first step, when developing a tire solution for mining tires, Michelin focused on understanding pain points in the value chain, and discussed who would be able to pay for a solution and who could be partners to deliver the solution.
Later, stronger cross-functional collaboration and interaction with partners is required to bring concepts to market.

II. Attract & Win

Description

- The new business model is piloted with target customers and runs parallel to the traditional business model
- Cross-functional collaborations are established by involving key functions in solution development
- A customer-centric culture is introduced throughout the company and customers play an integral part in solution development
- The company boundary gets more permeable as more and more stakeholders are engaged to form an ecosystem

Example: Michelin Case

- Michelin established an incubator programme office that is in charge of identifying client needs as well as internal processes that can be improved to respond to them
- The programme office provides guidance on agility and methods to involve external and internal stakeholders
- Michelin grows the identified projects as far as possible and tests them on the market to ensure their viability
Finally, to scale and adopt multiple circular initiatives, all stakeholders need to converge to an ecosystem

Description

- The new business models are scaled and the business is pivoted to the new, phasing out old business models
- Customer-centricity is fully established and applied throughout the organisation and integrated across the portfolio
- An ecosystem of partners has developed, and it is characterised by multilateral exchanges and interactions instead of one-to-one relationships

Example: Michelin Case

- Michelin leverages the overall ecosystem by drawing on
  - Strategic partners to jointly develop solutions to ensure credibility through a network of recognised partners (e.g. insurance company, telecom provider)
  - Business partners to benefit from their technical or commercial expertise to extend solution benefits with non-core services (e.g. automotive manufacturer)
The business transforms over time, incorporating prototyping, customer-centricity and ecosystem engagement into its DNA

I. Explore & Shape
Develop concepts for target business models, look for partners, design and test prototype(s)

- Customer-centric approach to find minimal viable product through rapid prototyping
- Engage with key partners and customers through dedicated project team

II. Attract & Win
Develop processes and partnerships and pilot new solution to convey benefits

- Pilot new business model with target customers in parallel to traditional business model
- Establish cross-functional collaborations by involving key functions in solution development
- Focus all processes around customer needs and open company boundary to engage with more and more stakeholders

III. Scale fast & keep growing
Adopt multiple circular business models across own operations and value chain

- Phase out old business models
- Embrace and live a customer-centric culture
- Be connected with an ecosystem of partners in multilateral exchanges

Illustration of company state

Key characteristics

See next slides for details
Companies typically face several barriers during their circular transformation journey

Type of Barrier | Challenges | Recommendations
---|---|---
Organisational & Cultural | • Change in culture requires changes in behaviour, value and mindset of employees  
• Cross-functional collaboration and customer-centricity required for the culture of circular business are often not yet well developed in linearly operating companies – neither on company or function-level  
• As the owner of customer relationships, the sales team needs to endorse the new circular culture  
• The transformation process needs to be well managed and embraced by leadership to support change in the long-term | 1. Address all components of culture  
2. Define company-wide and function-specific components  
3. Put special focus on sales team  
4. Manage culture change with a dedicated programme

Ecosystem-related | • Full circular potential in value chains from joint delivery of services and new configuration of value chains requires a diverse set of capabilities. Only big companies will be able to establish such an ecosystem themselves – others can develop an ecosystem of partners  
• To engage with ecosystem partners, actors that can provide the required capabilities and know-how need to be identified  
• Framework conditions form the prerequisite of how the ecosystem and business models can unfold. While some new business models face the challenge of operating without any legal guidance, others face hindering conditions | 5. Understand full circular advantage from collaborative ecosystem opportunities  
6. Identify partners to develop ecosystem  
7. Be aware of framework conditions and actively engage to shape them

External | • Companies with a well running business model do not perceive a need to invest in circular business models that come with different funding requirements, risks and returns  
• With change in cash flow and asset structure, product as a service models change the overall business logic as compared to many other business models. This leads to risks that financiers and businesses often have difficulties to assess and mitigate  
• With e.g. changing cash flow structures, funding requirements vary for all business models, and therefore need to be well assessed and described  
• Funding sources are scarce, as only few financiers have circular economy experience | 8. Holistically assess CE benefit  
9. Understand business model specific funding requirements  
10. Develop mitigation strategies for PaaS specific risks  
11. Determine funding requirements  
12. Identify funding partner and instrument
Behaviour, values and mindset changes are required to deliver outcome-oriented solutions

Values
- The things we believe are most important
  - We have some awareness of our own values, but they are largely invisible to others

Mindsets
- The assumptions we hold about the way the world is
  - These are often invisible to us and to others – the things we take for granted

Behaviours
- The outward signs of culture
  - They are informed by underlying values and mindsets

Culture
- “The way we do things around here”
  - Culture is the sum of how people in the organisation assume, believe, and act. This differentiates from competitors
The culture of circular business has company-level and function-specific components

<table>
<thead>
<tr>
<th>Values</th>
<th>Mindset</th>
<th>Behaviours</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Company-level</strong></td>
<td><strong>Minimising resource consumption and environmental impact is key for license to operate</strong></td>
<td><strong>Voice new ideas</strong></td>
</tr>
<tr>
<td>Sustainability</td>
<td>Things that increase client value are prioritised</td>
<td><strong>Use impact on client value as measure to prioritise activities</strong></td>
</tr>
<tr>
<td>Customer value creation</td>
<td>Sharing among colleagues is caring</td>
<td><strong>Share know-how and experience across functions</strong></td>
</tr>
</tbody>
</table>

**Function-specific**

| Design/ R&D | **The resource efficient way will be the better way in the long-run** | **Apply circular design criteria** |
| Sourcing & Procurement | **Recycled/ reused/ renewable material should be used where possible** | **Consider the whole life cycle in design** |
| Manufacturing | **Repairing a product or component is better than producing a new one** | **Explore new suppliers for material sources** |
| Sales & Aftersales | **Every unmet request of a customer is a potential new solution** | **Support designers in design for repair** |
| Take-back & Recycling | **Failing high recovery rates is failing value capturing** | **Have dialogue with customers to explore unmet needs** |
| Strategy & Leadership | **Leading by example is most effective** | **Aim at recovering and recycling as much as possible of products** |
| | | **Publicly praise employees for their contribution to the journey** |

---

**Did you know?**

On the Circular Economy site, there is a tool called Culture gap analysis, which helps you to understand how circular your company culture is, and identify actions to develop it further.
# Shifting aspects of the sales operating model supports culture change towards outcome-orientation

## Components of operating model in sales function

## Required changes to enable outcome-orientation

| **Know-how on costs to deliver solutions and cost implications for modifications are needed when selling customised solutions with differing features** |
| **The sales team needs to e.g. forward customer needs to design department and request input on feasibility of customer wishes** |
| **Integrated databases are required to get easy access to information from the whole product life cycle** |
| **Performance indicators and connected incentives need to be forward-looking and consider development over time** |

## Required changes to facilitate customer-centricity

The culture transformation in a company can be facilitated by a dedicated change programme

Example change programme

A component manufacturer faced the challenge of below average ESG performance, reputation of poor service quality and, connected with this, reduction in market share. This is their culture transformation journey:

- They started the journey with a survey across all levels and some in-depth interviews with key internal and external stakeholders to get a holistic view of the situation and to develop a vision of where to transform to.

- They developed a change story describing how they got into the current position, where they want to be, how they plan to get there and what the change means for the individual employee.

- The transformation process started with engagement workshops in which employees were asked to select a number of initiatives in which they would have the opportunity to demonstrate their commitment to change – giving employees a long-list to decide from increases uptake of activities.

- Furthermore, “Catalyst Projects” aiming to demonstrate visible changes in values and behaviours were started. They were cross-functional, on top of the company agenda and highly visible.

- The transformation process was accompanied by several communication tools to constantly make employees aware of it. This included intranet posts, articles in corporate magazines, workshops and emails answering questions.

- For leadership, dedicated peer-learning sessions were conducted to exchange experiences and discuss challenges and opportunities.

- The first phase of the programme culminated in an event to celebrate the successes of the catalyst project and officially launch the new vision.

Overview of activities

1. Develop vision
2. Formulate change story
3. Conduct engagement workshops
4. Kick-off catalyst projects
5. Release company-wide communications
6. Conduct regular leadership peer-learning sessions
7. Celebrate company event

1: Environmental, social and corporate governance
Taking an ecosystem approach opens new circular business opportunities

5. Understand full circular advantage from collaborative ecosystem

**Illustrative examples**

**Bundled offerings**
Make e.g. sharing concepts more attractive for customers

**Joint delivery of services**
Increases service spectrum to deliver product life extension

**Value chain reconfiguration**
Improves collection of material for reuse and recycling

**Ecosystem design**

- Partner with companies offering complementary services or products (e.g. insurance for shared products)
- Enables to capture value from underutilised capacity of products by addressing potential customer pain points upfront

**Opportunity**

- Partner with companies delivering use phase services and technology companies enhancing own product e.g. for remote control
- Enables to operate business models that require capabilities currently not available at a company (e.g. onsite maintenance and repair services)
- Enable high quality recycling of large (mostly) uniform material that is currently not recoverable in a linear value chain

**Challenges**

- Identifying relevant product/service combinations
- Potential cannibalisation of individual product/service sales
- Distribution of captured value among partners
- Exchange of information on material/material composition
- Work towards unification of input material (as required)
- Purity of recovered material in collection

**BM relevance**

- [ ] Circular supply chain
- [ ] Sharing platform
- [ ] Product Life Extension
- [ ] Recovery & Recycling
- [ ] Product as a service

...to cross-industry value networks

Enhanced capability to deliver extended value propositions and superior customer experiences
Ecosystem partners can help in bridging internal capability gaps

Development of Ecosystem over time

External ecosystem partners

Customers
• Current or potential new customers
• Reveal insights on needs and iteratively improve solution

CE Thought-leaders
• Universities, networks and peers with extensive CE knowhow
• Serve as source of inspiration, sounding board and (peer-) learning forum

Suppliers & delivery partners
• Goods and services providers for internal use and collaborative solution delivery
  (waste/ material management, logistics, insurance, payment solutions, ...)
• Grant access to circular material, are partners for joint generation of circular material or partners for service delivery

Technology providers
• Providers of technologies and software enabling digital solutions or internal processes
• Engage in solution and production process design and supply required technology

Financiers
• Public institutions, banks, investment funds, supply chain partners
• Give access to funding required for offering the CE business model

Public and societal actors
• Governments, associations and other representatives
• Influence public perception and opinion and influence or set framework conditions

Did you know?
On the Circular Economy site, there is a tool called Ecosystem partner identification, which helps you in identifying ecosystem partners to support with your circular business idea.
Regulations around circular economy are evolving but do not give aspired level of support

7. Be aware of framework conditions and actively engage to shape them

<table>
<thead>
<tr>
<th>Type of regulatory barrier</th>
<th>Effect for business</th>
<th>Example case</th>
</tr>
</thead>
</table>
| Missing regulations                         | • Uncertainty about legal status of operations or requirements to pursue the business  
                                          | • Risk of engaging in new model that then is prohibited by new regulations        | • Sharing platforms such as Airbnb and Uber face difficulties of missing    
                                          |                                                                                      | framework that provide required flexibility                                 
                                          |                                                                                      | – e.g. missing appropriate tax collection laws                                 |
| Current regulations promoting linear models | • Distortion of competition for circular businesses due to prices from linear models  
                                          | that do not show true costs (neglecting environmental costs/externalities)        | • 6.5% of global GDP went to subsidising fossil fuels in 2013                
                                          |                                                                                      | • Tax payers pay more than 90% of the cost of recycling plastic              |
| Current regulations hindering circular models| • Costs from increased administration                                               | • Definition of material classifications (e.g. “secondary material” status vs. “waste” status)  
                                          | • Hindrance to harness circular value opportunities                              | • WEEE is the only category where hazardous substances have been            
                                          |                                                                                      | comprehensively restricted for by legislation                                 |

Engage in shaping regulations through
• Partnering with larger players
• Seeking for legal assistance
• Participating in political discourse
A clear value case helps companies to overcome hesitations towards engaging in the investment

Common situation in business

“We have full books – why should we change something?”

“Our clients are not asking us – no need to change”

“All resources are tied-up, we have no capacity to change”

Holistic value of CE can outweigh rejections

Grow revenue
- Expand offering along a product’s life cycle by services, 2nd life sales, and recycling
- Offer new solutions
- Address new customer groups

Increase intangible value
- Differentiate from competitors beyond the product
- Increase customer satisfaction
- Improve reputation

Manage costs
- Increase in resource productivity
- Identify new suppliers
- Reduce transaction costs through cross functional collaboration

Mitigate risk
- Reduce supply chain risks
- Reduced dependency towards volatile commodity markets

Did you know?
On the Circular Economy site, there is a Value case tool, with which you can calculate a high-level business case, including investment need, for circular economy business models for your company.
Income throughout a product life cycle can increase by 75% through circular business models

In this example, circular business models can increase current revenues as follows:

- Services: 25%
- 2nd Life sales: 50%
- Recycling: 3%

Based on estimates for automatic and micro dive
Circular business models have three funding requirements that vary in level of risk and return

<table>

<td></td>
</tr>
</tbody>
</table>

1 Deep dive on following page
Financial, legal and market-related risks need to be mitigated to convince financier to fund PaaS model

Risks of Product as a service model

**Financial**
- **Default of payback** due to longer payback periods for the required working capital
- **Illiquidity** and costly collection of collateral due to assets being located at customer sites
- **Decreasing value of collateral** over time due to depreciation
- **Unknown residual value** of many products, due to small market of circular output companies

**Legal**
- Discontinued payment of service in case of client bankruptcy by liquidator and limited ability to get product back (depending on products e.g. power-by-the-hour)
- Legal **ownership of assets** might get lost due to legal accession (e.g. in real estate)

**Market-related**
- **Lacking demand** of offered service as customers and companies are currently used to owning products
- Lower **solvency of customers** attracted by PaaS due to reduced level of individual payments
- Availability of stable **second hand market** required for valuing collateral

Mitigation strategies

Financial
- Shorten payback period by changing pricing model to get higher cash flows in beginning
- Show benefit of higher and more stable profit margins based on additional lifecycles and reduced dependence to volatile commodity prices
- Leverage supply chain for securities i.e. supply chain finance/ reversed factoring

Legal
- Collect deposit to reduce risks connected to bankruptcy
- Design service cut-off function (e.g. remotely disable engine in case of default of payment) to incentivise continued payment
- Diversify contract and client portfolio

Market-related
- Check creditworthiness of customers
- Introduce risk premiums in pricing scheme

Mitigation strategies are important to convince internal or external financiers, depending on the individual funding requirements
Across all business models, funding requirements can be determined in four steps

1) Model expected net cash flow
   - Estimate price or monthly fee appropriate for product or service (depending on e.g. asset handling, insurance, services, operating costs)
   - Model growth scenario taking into account the cyclic back-flow of assets in different conditions
   - Calculate expected net cash flow based on fees and scenario

2) Define financing needs
   To offer circular business models companies need to
   - Secure finance for upfront investments: Development of product, set-up of infrastructure, training of workforce etc. need to be financed
   - Secure working capital during operations: Especially relevant for PaaS – Products and spare parts delivered to customers but paid-back over a certain period of time need to be pre-financed. Capital needs to be flexibly available as new products need to be financed as soon as new contracts are signed

3) Assess risks and offer securities
   The cashflow logic of all circular business models but PaaS is similar to linear value creation. Therefore, only for PaaS risks and collateral assessment varies. Following aspects are relevant:
   - Client quality: Depends on solvency and a combination of number and diversity of clients. A strong portfolio offers security as it buffers the risk of default of payments
   - Asset quality: Depends on the existence of a second hand market for the product and the condition of used products. A high resell price reduces risk as it gives high collateral. In the worst case, collateral is scrap value of a product
   - Contract robustness: Depends on specifics of clauses such as termination fees or installment fees that reduce risk of high fluctuation of customers and deposits reducing risks of default in payback in case of bankruptcy

4) Select funding sources
   Companies can more easily use internal funding or approach external financiers. If external funding is required, the appropriate funding instrument and source is dependent on funding volume and risk. Factors influencing the risk are e.g.
   - Availability of collateral in company
   - Maturity of offering
   The next pages give details on instruments and sources.

Source: 1: European commission (2016): Flash Eurobarometer 441 - European SMEs and the Circular Economy
Credit lines, leasing and bank loans can also be used to fund CE activities

Financing CE activities in SMEs in EU

About 60% of SMEs engaging in circular economy invested some share of their turnover to conduct the initiatives\(^1\)

- The most common external funding source for CE activities is a standard bank loan\(^1\).
- Accessing external funding is perceived to be difficult – however, less companies actually encounter difficulties than expected before trying to secure funding (58% of companies that required external funding stated they had difficulties. Among companies that did not yet conduct circular activities but would require external resources, 78% expect it to be difficult).\(^1\)

General SME financing in Finland

Credit lines, leasing and bank loans are the most relevant funding sources for SMEs in Finland\(^2\)

- Only 6% of Finnish SMEs rate access to finance as their most important concern – for 69% this is availability of skilled staff or competition and regulation\(^2\)
- 17% of SMEs applying for bank loans did not get the (full) bank loan they had planned for\(^2\)
- 43% of SMEs used financing for fixed investments, 40% for inventory and working capital, and 26% for developing new products\(^2\)

1: Answers to the question: “Over the last 3 years, what percentage of your company’s turnover have you invested on average per year to undertake [Circular economy] activities?”, n=7,771 European companies that stated to conduct circular economy activities, Source: European commission 2016 – European SMEs and the circular economy (Link); 2: European Commission 2017 -SME access to finance conditions 2017 SAFE results – Finland (Link);
Besides bank loans, other funding sources and instruments can be explored for CE funding

<table>
<thead>
<tr>
<th>Funding source</th>

<th>Application in circular businesses</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Banks</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Corporate debt (e.g. Bank loans, credit lines) | • Traditional lending that can finance circular investment needs  
• Requires guarantees from company |                                                                                                  |
| Leasing                         | • Can enable Product as a service business models  
• Applicable for products with predictable residual value or creditworthy company |                                                                                                  |
| Invoice factoring, Purchase order financing | • Can increase working capital and thus support PaaS business model  
• Applicable for companies with solid client or supplier base |                                                                                                  |
| Warehouse financing             | • Can enable e.g. product life extending businesses models that might lead to increase in inventory  
• Applicable for products with predictable residual value in mid- to high price range as storage fees need to be considered |                                                                                                  |
| **Capital markets**             |                                                        |                                                                                                  |
| Equity finance                  | • Only applicable for larger and mature circular businesses that meet the scale and requirements of the capital markets |                                                                                                  |
| Debt finance (Green bonds)      |                                                        |                                                                                                  |
| **For-profit investors**        |                                                        |                                                                                                  |
| Crowd funding                   | • Applicable for circular businesses that involve the (local) community or those based on ideas that appeal to the crowd |                                                                                                  |
| Venture capital, private equity | • Only partly applicable for circular businesses as high growth and relatively fast payback horizons are required |                                                                                                  |
| Foundations & impact investors  |                                                        |                                                                                                  |
| Grants, loans                   | • Suitable for circular businesses that are at a pilot stage and not profitable yet or are lacking a track record |                                                                                                  |

Exec. Summary
The three key Finnish banks are open for circular or sustainable businesses

Market shares of stock of loans to Finnish non-financial corporations (December 2017)\(^1\)

<table>
<thead>
<tr>
<th>Bank</th>
<th>Market Share</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP Financial Group</td>
<td>39%</td>
</tr>
<tr>
<td>Danske Bank</td>
<td>9%</td>
</tr>
<tr>
<td>Nordea</td>
<td>31%</td>
</tr>
<tr>
<td>Others</td>
<td>22%</td>
</tr>
</tbody>
</table>

**OP Financial Group**

Example SME specific offerings:
- Loans with the European Investment Fund (EIF) InnovFin risk-sharing guarantee
- Factoring services to finance receivables
- Leasing of assets from a supplier of choice for a specific period

**CE related expertise**: OP is behind the DriveNow car sharing service in the Helsinki region. They rent out cars on a pay per minute basis according to the DriveNow concept. OP owns the cars and generates revenues through user fees and registering. They can thus draw on own experiences for the PaaS business model.

**Nordea**

Example SME specific offerings:
- Asset life cycle management with leasing services and multiple options at the end of lease period
- Factoring services to finance receivables
- Wholesale financing and management offering a stock funding process

**CE related expertise**: Nordea positions itself as an enabler of sustainable business models and has experience with e.g. Product life extension as shown in the customer story of the Swedish company Inrego, an electronic device refurbisher.

**Danske Bank**

Example SME specific offerings:
- Loans for different needs
- Factoring services to finance receivables
- Leasing services

**CE related expertise**: Danske Bank does not position circular economy as a focus area but concentrates on carbon reduction. It states to consider environmental, social and governance risks in lending practices in collaboration with customers. Furthermore, they claim to engage in knowledge sharing and stakeholder engagement from climate change.

Source: Company websites; 1: Bank of Finland
Other public and private funding institutions can provide alternative funding sources

Public funding institutions

- Finnish Ministry of Economic Affairs and Employment provides €2m funding for CE initiatives in 2019
- Business Finland offers funding programs for SMEs e.g. to support international expansion
- Finnvera gives guarantees against political or commercial risks associated with the financing of exports
- TESI offers funds and direct investments to support growth and has Circular economy as a new focus
- The EIB and European Commission finance the European Fund for Strategic Investments (EFSI) with €250bn available until 2020. OP Financial Institute can be approached to access the fund in Finland
- InnovFin provides guarantees and counter-guarantees on debt financing of up to €50m for companies with <3000 employees (grants from 7.5-25mn are directly delivered by the EIB)
- Under Horizon 2020, the European commission funds CE research between 2018 and 2020 with €1bn

Private funding

- A financing company that operates the world’s first Private Equity Circular Economy Fund
- An independent provider of financial solutions for growth companies, drawing on different sorts of funding solutions (equity, debt, EU and government funding)
- Loudspring is an accelerator for companies that aim to save natural resources – generally in early stage.
- A specialised private equity firm investing in SMEs that operate in the circular economy (£1-5mn)
- A fund that invests in sustainable consumer goods companies, advanced recycling technologies and services related to the circular economy

Concluding remarks

By now you should have a better understanding of...

• How circular economy and specific business models can create a competitive advantage and bottom line impact
• What will be required from your organisation and operations to deliver on the ambition
• What barriers you are likely to encounter and how to overcome those as you start to transform your business

As next steps, we encourage you to...

• Revise your first hypotheses together with selected business representatives
• Summarise insights (use circular business model canvas introduced on the next page)
• Gather a project team and get started!
The business model canvas helps you to summarise the key building blocks of your circular business model

Industry deep dives

Current state analysis and circular opportunities for Machinery & Equipment, Marine, Energy & Transportation
This chapter will help you to:

- Gain in-depth knowledge of the current state and leading circular economy examples of your industry
- Compare your starting point to others in your industry and identify most relevant circular business models for your company

CHAPTER SUMMARY

Industry deep dives

- Machinery & Equipment, Marine, Energy and Transportation are important ecosystems within the Finnish manufacturing industry, representing almost 40% of Finland’s manufacturing exports
- Therefore, these sub-sectors play a key role in driving wider adoption of circular business models across the Finnish business landscape
- This section takes a deep-dive into the current state of these four sub-sectors, looking at inefficiencies in the current value chains and showcasing leading circular economy examples
- Overall, inefficiencies occur in all parts of the linear value chains and the adoption of circular business models is limited in all studied sub-sectors
- Still, compelling circular business model examples from leading Finnish and international companies exist, and inspire others for action
The following sections take a deep dive into four important ecosystems within the Finnish manufacturing industry

- **Machinery & Equipment**: Manufacture of machinery and equipment, including e.g. engines and turbines, pumps, compressors and valves, agriculture, forestry, mining and metallurgy machinery, and lifting and handling machinery.

- **Marine**: Manufacture of ship parts and marine equipment, such as hull, propulsion and power engines, other systems and solutions and interior equipment.

- **Energy**: Manufacture of electrical equipment, such as batteries, accumulators, wiring and wiring devices, electric lighting equipment, transformers and electricity control apparatus.

- **Transportation**: Manufacture of motor vehicles, trailers and semi-trailers, and their parts and equipment.

Largest sector of the Finnish manufacturing industry, accounting for 13% of Finland’s exports and employing 15% of the workforce.

Over 900 companies with a turnover of EUR 8 billion, of which approximately EUR 1 billion from shipbuilding.

Employs over 15,000 people in Finland.

Export value of EUR 3 billion with strong expertise in special vehicle manufacturing.

Sources: Statistics Finland, Finnish Customs, Finnish Marine Industries
Quotes from selected companies

“Workshops were great and had mentally both feet on the ground and head in the clouds. In workshops co-operation with other participants was good and I especially liked the Round Robin –method. We could develop our shy ideas into concrete plans and roadmaps. Now it is up to us to proceed according to the roadmap step by step.”

Pasi Aaltonen, Vice President, COO, Arvo Piireinen Oy

“In Saxo Group we have been thinking for some years about the possibilities the circular economy can provide to us, and for the environment naturally. So we had a few ideas when we entered to the program as one of the pilot companies. The playbook worked for us as a systematic approach to further develop our ideas in a very concrete way. It is a tool which requires concentration and time to learn how to use it but we think it is absolutely worth the time spent for it. Like most of the similar tools it really helps to take different aspects into consideration and to build a business case where at least the most important factors have been thought.”

Jari Vuorinen, Managing Director, Plastone Oy (part of Saxo Group)

“The circular economy will have an increased relevance for companies strategies and business models in the future. It was great to participate in the circular economy introduction programme. It was well managed, gave a structured approach to the topic and a good set of tools for continued work to find new possibilities to develop our and our customer’s business.”

Petri Paavolainen, Managing Director, Dinolift
Machinery & Equipment
Current state analysis and circular opportunities
Currently, the Machinery & Equipment value chain is focused on building efficient, long-lasting products.

**Raw material processing**
- Producing raw materials including:
  - Steel
  - Iron
  - Aluminium alloy

**Components manufacturing**
- Manufacturing components, such as:
  - Simple metal components that mainly include bending, moulding and casting (pipes, screws, hinges etc.)
  - Other components such as plastic support structures and electrical equipment

**Manufacturing**
- Manufacturing all types of machinery and equipment, such as:
  - Engines and turbines
  - Pumps, compressors and valves
  - Agriculture, forestry, mining and metallurgy machinery
  - Lifting and handling machinery

**Logistics**
- Providing transportation services, such as:
  - Transportation of entire plants, large shipments of industrial equipment, production lines, large-scale systems and devices.

**Operation/End-use**
- Creating products and services of industrial customers in various sectors such as:
  - Logistics, automotive, general manufacturing, mining, agriculture, pulp & paper, construction and energy

**Decommissioning**
- Offering products and services such as:
  - Recycling: including the demolishing, transportation and recycling of old industrial equipment
  - Providing raw materials extracted from the recycled products

**Key Products/Services**
- Production of raw materials including:
  - Steel
  - Iron
  - Aluminium alloy

- Manufacturing components, such as:
  - Simple metal components that mainly include bending, moulding and casting (pipes, screws, hinges etc.)
  - Other components such as plastic support structures and electrical equipment

- Manufacturing all types of machinery and equipment, such as:
  - Engines and turbines
  - Pumps, compressors and valves
  - Agriculture, forestry, mining and metallurgy machinery
  - Lifting and handling machinery

- Providing transportation services, such as:
  - Transportation of entire plants, large shipments of industrial equipment, production lines, large-scale systems and devices.

- Creating products and services of industrial customers in various sectors such as:
  - Logistics, automotive, general manufacturing, mining, agriculture, pulp & paper, construction and energy

**Example Actors**
- SSAB
- AcelorMittal
- Outokumpu

**Example Initiatives**
- Production of raw materials including:
  - Steel
  - Iron
  - Aluminium alloy

- Manufacturing components, such as:
  - Simple metal components that mainly include bending, moulding and casting (pipes, screws, hinges etc.)
  - Other components such as plastic support structures and electrical equipment

- Manufacturing all types of machinery and equipment, such as:
  - Engines and turbines
  - Pumps, compressors and valves
  - Agriculture, forestry, mining and metallurgy machinery
  - Lifting and handling machinery

- Providing transportation services, such as:
  - Transportation of entire plants, large shipments of industrial equipment, production lines, large-scale systems and devices.

- Creating products and services of industrial customers in various sectors such as:
  - Logistics, automotive, general manufacturing, mining, agriculture, pulp & paper, construction and energy

*Examples of circular economy initiatives pursued by some Finnish companies in the industry.*
However, inefficiencies occur in all parts of the Machinery & Equipment value chain

</tr>
<tr>
<td>UNEXPLOITED CUSTOMER ENGAGEMENTS</td>
<td>• The full potential of after-sales and add on sales is not exploited, but many companies are exploring new service-based offerings</td>
<td>• The share of revenues from after-sales services for most companies is 5.1-10%, while industry leaders can get up to 60% depending on their strategy</td>
</tr>
</tbody>
</table>

Analysis based on desktop research, insights from workshops with SMEs and interviews with industry experts.
To address these inefficiencies, Machinery & Equipment companies should explore the five circular business models

 Reform use of resources

 CIRCULAR SUPPLY CHAIN

 Build to last – Design products that are durable and easy to repair (e.g. modular).

 Circular supplies – use recyclable materials in production, e.g. renewable and bio-based materials, chemicals & energy to increase recovery rates.

 Recover value in waste

 RECOVERY & RECYCLING

 Recycle / upcycle – Collect and recover materials of end-of-life products and reuse them in own production.

 Return – Return wasted parts and materials to the source (e.g. waste and by-products from own production).

 Optimise capacity use

 SHARING PLATFORM

 Share – Develop solutions that enable increased use of capacity e.g. for machines that have high value and are easily transportable.

 Offer outcome oriented solutions

 PRODUCT AS A SERVICE

 Product as a service – Offer customers to use a product against a subscription fee or usage based charges instead of owning it, e.g. crane as a service.

 Performance as a service – Offer customers to buy a pre-defined service and quality level and commit to guaranteeing a specific result, e.g. through a subscription-based service agreement.

 Extend lifecycles

 PRODUCT LIFE EXTENSION

 Repair & Maintain – Deliver repair and maintenance services to extend the life of existing products in the market.

 Upgrade – Improve product performance by upgrading existing components with newer ones.

 Resell – Resell machinery, equipment and their parts that have reached their useful life to 2nd and 3rd hand markets.

 Remanufacture – Take back and perform industry-like restoration or improvement on original functionality of machinery, and parts and remarket them with lower price.

 Did you know?
 On the Circular Economy site, there is an exercise package called Business model development toolkit, where you can analyse the relevance of each circular business model for your company.
The five business models can be broken down to sub-models to circulate products and materials along the value chain

The circular value chain for machinery & equipment

As a Service models are mostly concerned with the operation phase, but span across the value chain

Additional circular business models

Circular supply chain
- Recycled direct materials
- Sustainable indirect materials

Sharing platform
- Virtual sharing platform
- Physical sharing platform

Recovery & Recycling
- Recover
- Downcycle

Product life extension
- Restore
- Repurpose
- Refresh

LEGEND
- Linear value chain
- Circular Economy Value Chain
- Circular Supply Chain
- Product Life Extension
- Sharing platform
- Product as a service
- Recovery & Recycling

Most circular opportunities are in the product use phase, bringing companies closer to their customers.

Source: Accenture, Appendix 2 for more details
Modular product design can improve operational efficiency and enhance durability and reparation of products

Leading examples: Circular Supply Chain

The Valmet OptiConcept M is a modular paper machine concept for sustainable papermaking. The concept combines the advantages of standardisation with modular tailoring, leading up to 30% lower energy consumption and fresh water consumption compared to traditional production lines. Thanks to its compact design, OptiConcept M requires up to 40% less paper machine hall space, having a positive impact on total investment cost.

The Outotec cPlant is a modular flotation plant that offers fast, effective and affordable solution for small mine sites or sites requiring extra capacity. The flotation plant is based on pre-fabricated and functionally tested modules inside container-sized steel frames that can be easily transported and installed, and quickly connected to the process.

Source: Company websites
Sharing platforms increase utilisation rates and maximise value contribution of products

Leading examples: Sharing platform

EquipmentShare is a construction machinery marketplace, including equipment such as forklifts, mobile generators and drill rigs. The rental price depends on the equipment weight, and the platform takes a cut of every transaction that occurs on the marketplace. In 2016 Equipment Share handled transactions of over 120 000 000 USD and over 2 500 construction companies.

eRent1 is a Finnish start-up company that offers a digital platform for companies where machines, devices and other goods can be shared and tracked. eRent aims to improve the utilisation rate of equipment and eRent’s main clients are equipment rental agencies, construction firms and other industrial companies from all different sectors.

Source: Company websites

1 Still in early-stage development
PaaS\(^1\) transfers cost-of-ownership to the producer which can incentivise more efficient use of resources

Leading examples: Product as a Service

AMECO Heavy Machinery Rental Services rents industrial machinery such as cranes to construction businesses in Americas and Africa. The focus is on shorter-term projects, typically with a duration of up to six months.

As part of Metso’s lifecycle services, Metso offers a Cost per Ton Payment Plan opportunity. If choosing this, clients receive only one invoice based on their actual production tonnage which takes into account all associated cost for maintaining the equipment, including wear parts, spares, labour and any other needed Metso services.

With a GE Oil & Gas Contractual Service Agreement (CSA), GE carries the risk of equipment malfunction. The service is tailored to meet the unique needs and requirements of each client and it includes Asset Performance Management for continuous equipment monitoring and diagnostics to maximise equipment availability and reliability.

Tamturbo Compressed air as a service provides compressed air for industrial companies. The compressor is based on a new technology, with a high-efficiency electric motor that allows it to produce compressed air without oil. When purchasing the service the customers do not need to worry about initial investments or maintenance, and Tamturbo can replace the product at the end of the contract to a new customer.

---

1 Product-as-a-Service
Source: Company websites

---
Remanufacturing, upgrade, and maintenance can extend product lifecycles and release new sources of value

Leading examples: Product Life Extension

The Cat Reman programme recovers materials through differentiated technology and employs environmentally sustainable practices to restore worn components to good-as-new condition. Remanufactured products are sold at a lower price with a like-new warranty. With the programme, Caterpillar recycles 134 million lbs annually, and is able to preserve ~85% of original energy "value add".

Ponsse Reman offers a quick, inexpensive and eco-friendly way for replacing damaged spare parts. Reman parts is a service developed by Ponsse and is based on recycling and reconditioning used parts. The customers receive a credit for the returned part when they simultaneously buy a Reman part.

Source: Company websites
Decommissioning and recycling can offer a competitive cost advantage in raw material supply

Leading examples: Recovery & Recycling

ZenRobotics develops and sells waste-sorting robots which separate different materials for reuse from waste. ZenRobotics is able to adapt to changing waste-management and legislation requirements, and it tackles the profitability issues of waste sorting. More precise sorting allows over 95% of waste materials arriving to waste-treatment facilities to be sorted for recycling.

Purkupiha provides planning and implementation of complete demolition of e.g. industrial halls, factories and buildings. The services include all areas of demolition, such as planning, asbestos removal, internal dismantling and sorting, mechanical demolition and the recycling of demolition waste. Purkupiha recycles and sells all reusable material and equipment.
Marine

Current state analysis and circular opportunities
The marine value chain is complex with a large group of heterogeneous players with varying circular maturity levels.

<table>
<thead>
<tr>
<th>Ship design</th>
<th>Raw material processing</th>
<th>Component &amp; equipment manufacturing</th>
<th>Assembly &amp; Integration</th>
<th>Operation</th>
<th>Maintenance &amp; Upgrade</th>
<th>Decommissioning</th>
</tr>
</thead>
</table>

**EXAMPLE ACTORS**
- **Ship design**
  - Provides ship design, offshore engineering and construction support
  - Services span from concept development to project management during shipbuilding

- **Raw material processing**
  - Produces raw materials including:
    - Aluminium & stainless steel
    - Composite material
    - Syntactic foam
    - Concrete

- **Component & equipment manufacturing**
  - Creates main equipment and integrated solutions, incl.:
    - Superstructure, rigging, etc
    - Propulsion and power engines
    - Other systems and solutions (e.g. HVAC, energy mgmt., navigation, safety, etc.)
    - Interior equipment (e.g. cabins, bathrooms, doors, etc)

- **Assembly & Integration**
  - Manufactures the hull of the ship and assembles the ship by cutting, forming, welding, fitting and joining the different parts of the ship together
  - Finalises the ship by:
    - Painting & coating the ship
    - Installing machinery & equipment
    - Furnishing the interior
    - Conducts dock and sea trials to test the ship and make final fixes
    - Organises a celebratory launch for the ship

- **Operation**
  - Equips the ship for transporting goods and/or passengers, and operates it

- **Maintenance & Upgrade**
  - Conducts repair, maintenance and conversion projects, incl. e.g. damage repairs, equipment replacements, refurbishing, and repainting

- **Decommissioning**
  - Provides various services for end-of-life vessels
    - Dismantling & cutting into blocks
    - Sorting out and processing materials
    - Washing & waste disposal

**EXAMPLE INITIATIVES**
- **Build to last – modular design principles**
- **Circular supplies – creates material with high recyclability**
- **Build to last – high use of modular design principles, some use of recycled materials**
- **Return waste materials to source**
- **Product as a service – only some players have started providing these**
- **Build to last – use of durable, modular products**
- **Increased use of innovative and environmentally friendly construction techniques**
- **Rental agreements – chartering**
- **Lifecycle services – repair, refurbishment, repainting, etc**
- **Recycle/upcycle**
- **Return**

*Examples of circular economy initiatives pursued by some Finnish companies in the industry

**First initiatives started only in late 2017**
Inefficiency | Description of current state | Illustrative data points
--- | --- | ---
**UNSUSTAINABLE MATERIALS** | • Most input materials in ships are recyclable and durable (e.g. steel)  
• Use of sustainable indirect materials is limited, and most efforts are focused on optimising the safety and energy efficiency of the ship during its operation | • On average, 96% of ship materials can be recycled or reused  
• Spend on sustainable indirect materials of all indirect material spend for marine companies varies between less than 5% and 50% |
**UNDERUTILISED CAPACITIES** | • Many ships are left unused for long periods of time or operated with limited use of available capacity, creating significant unnecessary costs and emissions  
• When it comes to operational fit, ships are typically custom-built, while for marine equipment both standardisation and customisation is used | • 10% of global container fleet is idle, and over 60% of unused capacity comes from less than 10 year old ships  
• About 20% of containers carried by ships are empty  
• Over 75% of ships operating in the Baltic seas spend over 40% in ports waiting for cargo loading/unloading, |
**PREMATURE PRODUCT LIVES** | • Ships are built to last for long lifecycles, but non-standardised equipment and components make remanufacturing of ships challenging  
• Ship operators are increasingly interested in refurbishment and upgrade projects to revitalise their aging fleet due to increased costs, stricter regulations and the lack of a 2nd hand market | • A typical lifecycle of a ship is 30-40 years |
**WASTED END-OF-LIFE VALUE** | • Ship dismantling and recycling activities are very limited in Finland due to lack of binding regulations and incentives  
• There are also limitations to profitably recycling materials such as fabrics, small manufactured items, and motors that cost more to reduce to scrap than the scrap is worth | • Only 16% of materials used in ship cabins are recycled, while 90% of them could be recycled |
**UNEXPLOITED CUSTOMER ENGAGEMENTS** | • After-sales and add-on sale efforts are limited for most marine industry players, but leading companies are exploring as-a-service business models to establish stronger customer relationships and increase their margins | • Marine companies report that their share of revenues from both after-sales and add-on sales is less than 5% |

Analysis based on desktop research, insights from workshops with SMEs and interviews with industry experts.

**Did you know?** On the Circular Economy site, there is an exercise package called *Business model development toolkit*, where you can make the same analysis for your company.
To address these inefficiencies, marine companies should explore the five circular business models

Reform use of resources

**CIRCULAR SUPPLY CHAIN**

- **Build to last** – Design products that are durable and easy to repair (e.g. modular).
- **Circular supplies** – use recyclable materials in production, e.g. renewable and bio-based materials, chemicals & energy to increase recovery rates.

Recover value in waste

**RECOVERY & RECYCLING**

- **Recycle / upcycle** – Collect and recover materials of end-of-life products and reuse them in own production.
- **Return** – Return wasted parts and materials to the source (e.g. waste and by-products from own production).

Optimise capacity use

**SHARING PLATFORM**

- **Share** – Develop solutions that enable increased use of vessel capacity.

Offer outcome oriented solutions

**PRODUCT AS A SERVICE**

- **Product as a service** – Offer customers to use a product against a subscription fee or usage based charges instead of owning it, e.g. engine-as-a-service, equipment-as-a-service, vessel-as-a-service.
- **Performance as a service** – Offer customers to buy a pre-defined service and quality level and commit to guaranteeing a specific result.

Extend lifecycles

**PRODUCT LIFE EXTENSION**

- **Repair & Maintain** – Deliver repair and maintenance services to extend the life of existing products in the market.
- **Upgrade** – Improve product performance by upgrading existing components with newer ones.
- **Resell** – Resell ship parts and equipment that have reached their useful life to 2nd and 3rd hand markets.

Source: Accenture, Appendix 2 for more details
Modular design principles and use of recyclable materials facilitate lifecycle extension and resource recovery

Leading examples: Circular Supply Chain

- Products are manufactured from durable, recyclable materials (stainless or acid-proof steel), and are therefore fully recyclable at the end of their lifecycle
- All excess materials from production are recycled and reused

- ABB has a strict approach to ensuring that all materials and components used in their products are sustainable
- The company has built sustainability into their product and technology development process, focusing on product design, material selection, and minimised material use and emission generation in manufacturing processes

- Wärtsilä applies a modular architecture in engine design to enable increased commonality and backward compatibility of parts
- This approach enables reduced product development costs, faster time-to-market, reduced maintenance time and costs and higher reusability of materials and components

- The Electric Blue smart ship has a flexible modular design, which can be tailored for specific requirements
- The ship comprises a simple steel hull with open top arrangement with cell guides, providing a framework for 20 and 40 foot containers that house various ship equipment ranging from fuel tanks to control bridges
- The modular design facilitates replacements and upgrades and enables a long lifecycle as the vessel can evolve with time and technology developments

Source: Company websites
Sharing platforms are most relevant in the operation phase, and can increase use of vessel capacity

Leading examples: Sharing platform

- AMLA facilitates vessel sharing arrangements between member operators to maximise efficiency and reduce marine logistics costs
- Through AMLA, member operators can increase revenue by shipping other operators’ cargo or reduce their chartering costs by taking space on a fellow member’s vessel
- The platform allows members to access available shippings up to a week ahead, and view real-time information on estimated cost and CO2 savings

- Blockshipping has created the Global Shared Container Platform (GSCP), which aims to be the first real-time registry of the world’s approximately 27 million shipping containers and a joint platform for all players in the industry for container sharing
- The platform aims to reduce the amount of empty containers, which is a significant issue in the shipping industry
- The platform is powered with blockchain and sensor technology and thus allows performing a wide range of transactions efficiently, such as container sharing
- According to Blockshipping, the platform has potential to reduce costs for the global shipping industry by $5.7 bn and reduce global CO2 emissions by more than 4.6 million tons every year

Source: Company websites
Demand for as-a-service models for marine equipment is increasing, providing new opportunities to explore

Leading examples: Product as a Service

- **The ‘Power by the Hour’ service agreement for vessels hands the responsibility for service planning and performance to Rolls-Royce instead of the ship operator.**
  - The operator pays a fixed charge per hour of operation, per ship, and Rolls-Royce monitors the equipment aboard each vessel from on shore with the help of onboard sensors.
  - The agreement insures the operator against downtime due to equipment failure and ensures optimised equipment performance.
  - Rolls Royce has estimated that the model could reduce customers’ maintenance cost by as much as 25% over a 10-15 year contract.

- **Wärtsilä has an advanced 12-year performance-based maintenance agreement with Carnival Corporation which covers all engine maintenance and monitoring work of 79 vessels and their 434 engines.**
  - The agreement includes Wärtsilä’s Dynamic Maintenance Planning (DMP) and Condition Based Maintenance (CBM), which leverage data analytics for real-time asset optimisation and predictive maintenance.
  - The value of the agreement is approximately EUR 900 million, enabling significant annual savings in fleet operational costs for Carnival.

Source: Company websites
Lifecycle services provide significant revenue potential for equipment manufacturers

Leading examples: Product Life Extension

- Schottel offers various modernisation solutions for its propulsion equipment to upgrade their performance instead of replacing them with new ones, including e.g. modernisation of steering systems and interfaces, retrofitting of propulsion systems, and propulsion upgrades
- The solutions reduce maintenance time and costs, prevent unexpected stops and downtime, reduce damage and risk of breakdown, and ultimately extend the product lifecycles

- Smedegaarden sells high-quality second hand maritime equipment from scrapped vessels such as engines, engine parts, gearboxes, thrusters, pumps and anchors

- Condition-based maintenance service predicts equipment failure modes and risks related to potential failures and provides advice on when to perform repair and maintenance actions based on actual equipment condition and performance monitoring
- The solution increases reliability and availability of the vessel and reduces maintenance costs

- Evac is offering both retrofit and refurbishment services to upgrade the components of existing systems
- Upgrades extend the lifespan of the system and allow older vessels to benefit from the latest technologies

- Wärtsilä offers remanufacturing services for engine components, bringing worn out components back to their full functionality
- The quality of remanufactured components is equal to new ones, while their price is dramatically lower
- Therefore, the solution substantially reduces costs of maintenance while also reducing environmental footprint through material reuse

- Piikkiö Works offers turnkey wet cell refurbishment (Wetref) for cabins, which is a complete solution for upgrading the ageing wet cells of a ship
- Refurbishment extends the life cycle of the cabins and upgrades them to meet changing customer expectations

Source: Company websites
Recovery and recycling of ship parts, materials and equipment enables both cost and environmental efficiencies

Leading examples: Recovery & Recycling

- The material from Wärtsilä’s end-of-life components is used to create recycled material
- Recycled material, such as end-of-life coins and bronze propellers from propulsion equipment is used in casting new propellers, thus reducing the environmental impact of the products

Cradle-to-Cradle Passport – a database listing the material composition of the main parts of the ship enabling better recycling of materials and parts used in vessel construction
- The database will cover about 95% (by weight) of the materials and updating it involves around 75 suppliers to the ship

Sead2Cradle provides a hassle-free way for ship owners to handle the recycling of their vessel by making a ship recycling plan, finding a buyer, and supervising the dismantling and recycling at the demolition yard
- The company has high standards for green ship recycling, currently recycling more than 95% of all materials and aiming for 100%

Kongsberg provides a recycling service for recycling all Kongsberg Maritime products and equipment
- The service is free of charge, and ensures that worn equipment is recycled or disposed responsibly

Source: Company websites
Energy
Current state analysis and circular opportunities
Currently, the electrical equipment value chain aims to build durable and energy-efficient products

Components manufacturing | Components distribution | Manufacturing | Wholesale | Installation & Operation | Collection

EXAMPLE ACTORS
- **SUMITOMO ELECTRIC**
- **crydom**
- **Amphenol**
- **Vacon**
- **ABB**
- **Helvar**
- **SLO**
- **ahl sell**
- **omm nen**
- **ABB**
- **I&T**

EXAMPLE PRODUCTS/SERVICES
- Manufacturing electrical components such as diodes, transistors, hall and current sensors, thyristors, optoelectronics, displays, discharge devices and resistors
- Distributing electrical components, often with a large variety of products from numerous suppliers globally
- Manufacturing electrical equipment such as batteries, accumulators, wiring and wiring devices, electric lighting equipment, transformers and electricity control apparatus
- Distributing electrical equipment
- Producing power generation, distribution and other utilities
- Key customers are in the sectors of, e.g., construction, energy, raw material producing or industrial equipment manufacturing
- Collecting and recycling electrical waste
- Building to last: products are planned to be durable and energy efficient at the product installation & operation - phases
- N/A
- Product life extension services and recovery and recycle services initiatives are increasing
- N/A
- Product and performance as a service: selling results instead of a product
- Recycling/repair and return: re-usage and remanufacturing is getting more common

*Examples of circular economy initiatives pursued by some Finnish companies in the industry*
Still, inefficiencies occur in all parts of the electrical equipment manufacturing value chain

<table>

<tr>
<td>PREMATURE PRODUCT LIVES</td>
<td>• Electrical equipment is often replaced due to limited opportunities for upgrades and customers opting for the products with the newest technologies</td>
<td>• Most energy companies report that at least 50% of their revenues come from products designed for a long life – however, products are not always designed for enhanced reparability or upgradeability e.g. through modular design</td>
</tr>
<tr>
<td></td>
<td>• Due to challenging conditions and improper care not all electrical equipment reach their technical life targets</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Equipment maintenance often happens according to schedule, not need, wasting resources</td>
<td></td>
</tr>
<tr>
<td>WASTED END-OF-LIFE VALUE</td>
<td>• Recycling of electrical equipment is very limited, as the process is costly and the value of recovered materials is low</td>
<td>• Most energy companies report that they recycle less than 5%, if any, of end-of-life products</td>
</tr>
<tr>
<td></td>
<td>• Also, many products are sold outside Finland and Europe, making their take-back and recycling challenging</td>
<td></td>
</tr>
<tr>
<td>UNEXPLOITED CUSTOMER ENGAGEMENTS</td>
<td>• Providing outcome-oriented solutions is very rare in the industry</td>
<td>• Most energy companies report that their share of revenues from both after-sales and add-on sales is less than 5%</td>
</tr>
</tbody>
</table>

Analysis based on desktop research, insights from workshops with SMEs and interviews with industry experts.

Did you know? On the Circular Economy site, there is an exercise package called Business model development toolkit, where you can make the same analysis for your company.
Therefore, electrical equipment manufacturing companies should explore the five circular business models

Reform use of resources

**CIRCULAR SUPPLY CHAIN**

- **Build to last** – Design products that are durable and easy to repair (e.g. modular).
- **Circular supplies** – use recyclable materials in production, e.g. renewable and bio-based materials, chemicals & energy to increase recovery rates.

Recover value in waste

**RECOVERY & RECYCLING**

- **Recycle / upcycle** – Collect and recover materials of end-of-life products and reuse them in own production.
- **Return** – Return wasted parts and materials to the source (e.g. waste and by-products from own production).

Optimise capacity use

**SHARING PLATFORM**

- **Share** – Develop solutions that enable increased use of capacity.

Offer outcome oriented solutions

**PRODUCT AS A SERVICE**

- **Product as a service** – Offer customers to use a product against a subscription fee or usage based charges instead of owning it.
- **Performance as a service** – Offer customers to buy a pre-defined service and quality level and commit to guaranteeing a specific result, e.g. through a subscription-based service agreement.

Extend lifecycles

**PRODUCT LIFE EXTENSION**

- **Repair & Maintain** – Deliver repair and maintenance services to extend the life of existing products in the market.
- **Upgrade** – Improve product performance by upgrading existing components with newer ones.
- **Resell** – Resell products that have reached their useful life to 2nd and 3rd hand markets.
- **Remanufacture** – Take back and perform industry-like restoration or improvement on original functionality of products and product parts and remarket them with lower price.

**Did you know?**

On the Circular Economy site, there is an exercise package called Business model development toolkit, where you can analyse the relevance of each circular business model for your company.
The five business models can be broken down to sub-models to circulate products and materials along the value chain

The circular value chain for energy

As a service models are mostly concerned with the product use phase, but address inefficiencies across the value chain

Additional circular business models

Circular supply chain
- Recycled direct materials
- Sustainable indirect materials

Sharing platform
- Virtual sharing platform
- Physical sharing platform

Recovery & Recycling
- Recover
- Downcycle

Product life extension
- Restore
- Repurpose
- Refresh

Most circular opportunities are in the product use phase, bringing companies closer to their customers.

Source: Accenture, Appendix 2 for more details
Modular design principles and use of recyclable materials facilitate lifecycle extension and resource recovery

Leading examples: Circular Supply Chain

Schneider Electric started a programme in January 2015, where they started upgrading products that had become obsolete while in storage. This means that instead of traditionally dismantling the products to raw materials and reusing the raw materials, they use as much of the old products components in new versions. The approach has been successful with product groups such as circuit breakers and wiring devices.

Vacon NXP System Drives have a modular design which enables customisation and cost savings. The product design also means that faults are reduced to certain components and the components can be changed quickly in case of a breakdown.

Source: Company websites
Sharing platform initiatives are mainly focused on the usage phase, allowing businesses and consumers to sell their excess energy

Leading examples: Sharing platform

Power Ledger is a blockchain-based cryptocurrency and energy trading platform that allows for decentralised selling and buying of renewable energy. The peer-to-peer energy marketplace allows sale of surplus renewable energy generated at residential and commercial developments connected to existing electricity distribution networks, or within micro-grids.

SOLshare is the world’s first peer-to-peer solar electricity trading platform that leverages existing solar home systems (SHS) in an off-grid context to create a bottom-up smart grid. The platform allows individuals to share their excess electricity with roughly a dozen other homes, of which some are equipped with solar panels and others not.

Source: Company websites
Product as a service business models align customer and client objectives to minimise product lifecycle costs

Leading examples: Product as a Service

Solnet offers solar power systems as a service, both on a turnkey basis and through service agreements, in which the customer pays a rate for the produced electricity. Solnet’s customers are primarily owners of large property portfolios.

Philips has several case examples of selling light as a service. This performance-based service can be sold through several business models, such as both pay-per-lux and monthly subscriptions. These service-based models often lead to lower lifecycle costs, energy reductions do to better optimisation and simplicity for the end-user.

Source: Company websites
Remanufacturing and maintenance services offer a deeper customer relationship and new business opportunities

Leading examples: Product Life Extension

ABB Drive Exchange offers a remanufactured drive for up to 30% of the cost of a new drive, when returning an old drive. The old drives are refurbished, used to refill exchange unit stock or recycled according to regulations.

ABB Transformer Remanufacturing and Engineering Services reduces downtime and minimises risk, while also extending the life of the transformers. The service provides quick and quality repairing in case of a transformer breakdown, time or condition based maintenance and repair services instead of reinstall.

The Schneider Electric Circuit Breaker Retrofit – programme modernises and updates electrical distribution centres. As a result of a timely upgrade, the maintenance costs can be significantly reduced, the product life prolonged and the technical capabilities improved.

Helvar has an offering of comprehensive lifecycle services from scheduled routine maintenance visits and remote system management to a fully managed comprehensive system maintenance package, which includes network and energy monitoring, system optimisation and a guaranteed upgrade path.

Source: Company websites
Collection and recycling can offer a competitive advantage to raw material supply, especially for scarce materials

Leading examples: Recovery & Recycling

The total Siemens recycling rate is 90% – which is far beyond complying with legal requirements. Siemens has its aims set even higher, by targeting for 0 waste to landfill, 100% of air emissions controlled and 6% improvement in energy efficiency.

Grundfos has a take-back scheme for used circulators. The scheme covers the Danish home market, and has been developed in cooperation with wholesalers. All major circulator wholesalers are participating in the voluntary scheme, corresponding to more than 200 wholesalers across Denmark.

SF6 is a commonly used gas by many manufacturers of medium- and high-voltage switchgear, and although it is not poisonous, it has high global warming potential. Schneider Electric has established systems were 99% of SF6 can be recycled, recovered and reused. In addition, they are able to recover 97% or more of the other material in a switch gear. The equipment owner pays Schneider for these recycling services.

Source: Company websites
Transportation
Current state analysis and circular opportunities
The transportation value chain is fairly circular, but improvement areas still exist - especially in resource use

---

**In scope**

**Out of scope**

---

**EXAMPLE ACTORS**
- Produces raw materials including:
  - Steel
  - Aluminium
  - Rubber
  - Plastic
  - Glass
  - Fabrics
- Manufacturers main parts and equipment of vehicles, incl.:
  - Bodies, trailers, semi-trailers
  - Parts, accessorion and systems (incl. engines, brake, seats, wheels, tires, exhausts, windows, HVAC etc)
- Provides services such as manufacturing engineering, body welding, painting and final assembly of vehicles
- Distributes vehicles for sale
- Provides vehicle sharing & rental services
- Provides repair & maintenance services (incl. damage repairs, repainting, reinstallation etc)
- Provides logistics services
- Provides repair & maintenance services (incl. damage repairs, repainting, reinstallation etc)
- Provides collection, treatment and recycling services for end-of-life vehicles, incl. separation of reusable components, crushing, and separation of materials to be reutilised

**KEY PRODUCTS / SERVICES**
- Circular supplies – creates material with high recyclability
- Build to last – durable products that are easy to repair, somewhat modular design
- Return
- Build to last – somewhat modular design principles
- Return
- Rentals – renting, leasing
- Rosell – market for used vehicles
- "N/A"
- Lifecycle services – repair, maintenance, refurbishment
- Remanufacturing
- Recycle / upcycle
- Return

**EXAMPLE CE INITIATIVES**
- Deep dives – Transportation
  - Why
  - What
  - Capabilities
  - Technologies
  - How

---

*Examples of circular economy initiatives pursued by some Finnish companies in the industry*
# Indeed, inefficiencies occur in all parts of the Transportation value chain

## Inefficiency | Description of current state | Illustrative data points
--- | --- | ---
**UNSUSTAINABLE MATERIALS** | • Most input materials are recyclable (e.g. metals) - however design of products is not optimised for continuous regeneration (materials are mixed together in components), increasing the use of virgin materials  
• The use of sustainable indirect material in production is also limited | • Companies report that their spend on sustainable direct materials varies between 20 to 80% of their direct material spend, while for indirect materials their spend remains below 50% of their total indirect material spend

**UNDERUTILISED CAPACITIES** | • Typically, vehicles are left unused for long periods of time and their full capacity is not used, creating significant unnecessary costs | • In Finland, average load rate of trucks is only 69%, and 23% of kilometers are driven without cargo. In rail transport, 47% of freight cars are transported empty

**PREMATURE PRODUCT LIVES** | • Most vehicles and vehicle components are durable and have long lifecycles  
• Still, vehicle maintenance mainly happens according to schedule, not according to need, wasting some lifecycle effects | • Most companies provide maintenance, repair and upgrade services for their products, and get more than 10% of their revenues from after-sales

**WASTED END-OF-LIFE VALUE** | • Most manufacturing waste and the majority of end-of-life products are recycled. However, increased complexity e.g. due to rise of customisation, use of glue in fixation and more advanced electronics makes recycling, repair and recovery of vehicles increasingly challenging  
• Dedicated product take-back schemes are rare | • Most companies report that they recycle over 80% of manufacturing waste, and at least 50% of end-of-life products

**UNEXPLOITED CUSTOMER ENGAGEMENTS** | • After-sales and add-on sales opportunities are relatively well exploited, compared to other manufacturing sub-sectors | • The share of both after-sales and add-on sales revenue is over 10% for most companies

Source: Accenture, Appendix 2 for more details
Modular design principles and use of recyclable materials facilitate recovery of parts and materials

Leading examples: Circular Supply Chain

- Around one third of materials in a new Volvo truck come from recycled materials, and up to 90% of the truck can be recycled at the end of its life, thanks to labelling components for easy identification and dismantling.

- Modularity and standardisation in engine design have been key principles at AGCO Power for decades.
- Common platforms thinking, with similar basic designs and shared parts reduce waste in production and make the aftersales operations more efficient.

Source: Company websites
Sharing platforms are more relevant in the vehicle use phase, where they enable capacity optimisation

Leading examples: Sharing platform

- TNX offers an innovative freight matching platform which matches cargo to vehicles, and optimises road transport by consolidating / bundling offers and generating dynamic and intelligent routes
- Thanks to the service, utilisation of trucks can be increased and empty running reduced

- Uber Freight is an on-demand freight service for trucking carriers which connects truck drivers with cargo that needs to be hauled long distances
- The goal of the service is to reduce the hassles of trucking, including e.g. downtime and deadhead miles

Source: Company websites
Product as a Service models strengthen customer relationships through shared risk and frequent interaction

Leading examples: Product as a Service

- Volvo Service Agreements guarantee the best possible uptime for buses and trucks against a monthly fee
- For example, the Volvo Gold Contract includes 100% uptime promise, remote diagnostics and preventive maintenance, and covers all repairs

- Tire as a Service leasing programme allows Michelin customers to lease tires against a pay per mile fee
- The service allows Michelin to establish the necessary control to re-introduce tires returned at the end of the leasing period, while reducing the risk associated with replacement for customers
- The company also offers sensor-based data analytics for predictive maintenance and fuel optimisation

- MAN offers trucks-as-a-service on a pay-per-use basis
- MAN owns the truck and uses telematics and digital connectivity to manage the risk and maintenance of the truck while the fleet operator is responsible for the fuel and driver costs

Source: Company websites
Various services can significantly prolong the lifecycle of a vehicle while also generating additional revenues

Leading examples: Product Life Extension

Renault reuses parts coming from its end-of-life vehicles, sales network, plants or suppliers, and sells these second-hand parts (body, lights, shield, etc) in affordable repair offers.

- Renault reconditions or remanufactures used parts, which are collected in the sales network, sorted and refurbished.
- The process involves complete dismantling, cleaning, sorting, refurbishment and replacement of faulty or worn parts, reassembly and inspection.

- Scania Service Exchange takes used and worn components (e.g. engines, gearboxes and clutch parts) – strips them down completely and remanufactures them.
- Components are remanufactured to the original Scania specifications and then tested exactly as brand new parts, and finally resold at a lower price.

- HealthHub, a condition-based predictive maintenance tool that monitors the health of trains, train infrastructure and signaling systems.
- The tool uses advanced data analytics to extend and maintain the useful life of trains.

Source: Company websites
Thanks to legislative initiatives, the transportation industry is a forerunner in resource recycling

Leading examples: Recovery & Recycling

- Scrap tyres, or tyres that do not meet quality standards, are taken to recycling directly from production
- 79% of production waste is recycled, 11% recovered as energy, and 8% reused
- Discarded tyres serve various reuse and recycling applications – they can be utilised e.g. as material or for energy production

- Ford performs closed-loop recycling, with auto parts materials recycled back to the same use
- For example, the company recycles 5 million pounds of aluminium scrap a week, which is enough to build 37,000 new F-series truck bodies
- Ford also upcycles some materials, such as milk bottles to be used as automotive components, and industrial fabrics to be used in seats

- GM recycles 84% of its worldwide manufacturing waste and has 111 landfill-free facilities
- By-product recycling and reuse generates approximately $1bn in annual revenue for the company

APPENDIX 1 – Circular maturity survey
**INTRODUCTION**

**Circular maturity survey**

The Circular maturity survey was conducted to understand the starting point of Finnish manufacturing SMEs in adopting circular economy principles.

### Purpose

The survey included two reflections:

1) Inefficiency assessment
2) Current adoption of circular business models

The first reflection focused on understanding the occurrence and level of the five inefficiencies of the linear model:

- Unsustainable materials
- Underutilised capacities
- Premature product lives
- Wasted end-of-life value
- Unexploited customer engagements

In the second reflection, companies were asked to assess their current adoption level of the 11 circular sub-models.

### Content

In total, 30 Finnish manufacturing SMEs replied to the survey. The responses were collected in industry-specific workshops and through an online survey in May-June 2018.

Detailed results of the survey are presented in the following pages.
Inefficiency assessment (1/5)

1) Unsustainable materials
Material and energy that cannot be continually regenerated (e.g. direct and indirect material is not renewable or bio-based)

Direct Material: What % of direct material spend is spent on circular material such as renewable, recycled or reused materials?

Indirect material: What % of indirect material spend (=not clearly allocated to a certain product) is spend on circular material such as renewable, recycled or reused materials?
Inefficiency assessment (2/5)

2) Underutilised capacity
Underutilised or unused products and assets (e.g. products are not operating full hours or full functionality is not used)

**Availability:** What % of time is the product not used by the customer/end user? (e.g. if only used in summer, 1h a day)*

- <5%: 6
- 5.1-10%: 4
- 10.1-20%: 2
- 20.1-50%: 8
- 50.2-80%: 6
- >80%: 3

* % of 24 hours x 365 days per year

**Operational fit:** to what extent does the product fit the requirements of the customer e.g. regarding operating efficiency, product operations planning?

- Poor fit: 0
- Partial fit: 0
- Full fit of standard solution: 9
- Full fit through customisation: 21
Inefficiency assessment (3/5)

3) Premature product lives
Products are not used to the fullest possible working life (e.g. due to new models and features or lack of repair and maintenance)

**Lifetime:** What is the current average duration of a product life (in years)?

- 2-4: 1
- 5-10: 1
- 11-20: 13
- >20: 15

**Functionality:** % of revenue that comes from products that are designed for a long life e.g. through enhanced repairability, modularity, upgradeability

- <5%: 2
- 5.1-10%: 0
- 10.1-20%: 0
- 20.1-50%: 1
- 50.2-80%: 7
- >80%: 19
4) Wasted end-of-life value
Valuable components, materials and energy is not recovered at disposal (e.g. not recycled or recovered at end of life)

### Waste in production: % of waste from production that is recycled (based on weight)

<table>
<thead>
<tr>
<th>Percentage Range</th>
<th>Value</th>

</tr>
</tbody>
</table>
Inefficiency assessment (5/5)

5) Unexploited customer engagements
Material and energy that cannot be continually regenerated (e.g. direct and indirect material is not renewable or bio-based)

**After-sales:** % of revenue from after sales services

- <5%: 11
- 5.1-10%: 8
- 10.1-20%: 5
- 20.1-50%: 3
- 50.2-80%: 1
- >80%: 0

**Add-on sales:** % of revenue from add-on sales

- <5%: 16
- 5.1-10%: 9
- 10.1-20%: 2
- 20.1-50%: 1
- 50.2-80%: 1
- >80%: 0
